Appendix,	185

# REPORT

TO

HIS EXCELLENCY LAWRENCE, EARL OF ZETLAND,  
K.C., &c., &c.

LORD LIEUTENANT-GENERAL AND GENERAL GOVERNOR OF IRELAND,

MAY IT PLEASE YOUR EXCELLENCY,—

I have the honour to submit, for your Excellency's consideration, the Twenty-seventh Annual Report on Marriages, Births, and Deaths in Ireland. The tables comprise all the usual details connected with the subject for the year 1890.

## GENERAL SUMMARY.

The Marriages registered in Ireland during the year 1890 number 20,990; the Births 105,254; and the Deaths 85,530. The marriage and death rates were slightly above, and the birth-rate somewhat below the average for the preceding ten years.

The recorded natural increase of population, or excess of births over deaths, was 19,404; the loss by emigration amounted to 61,313; there would thus appear to have been a decrease of 41,909 in the population during the year, but against a portion of this decrease there is a set-off in immigration, of which no official record has been obtained. The estimated population in the middle of the year (founded on the returns of Births, Deaths, and Emigration) was 4,688,462.

TABLE I.—Showing for each of the years 1880-90, the estimated Population; the number of Marriages, Births, and Deaths registered, and the number of Emigrants enumerated, with the rates per 1,000 of the estimated Population represented thereby; and the averages for the ten years 1880-90.

YEAR.	Estimated Population in the middle of each year.	Numbers Registered.			Number of Emigrants as returned by the Emigration.	Rate per 1,000 of Estimated Population.			
		Marriages.	Births.	Deaths.		Marriages.	Births.	Deaths.	Emigrants.
1880.	4,588,608	20,990	105,254	85,530	60,813	8.31	34.7	19.8	11.6
1881.	4,544,588	21,340	105,947	85,848	59,427	4.96	34.5	19.9	10.9
1882.	4,507,568	21,695	106,548	86,260	67,218	4.92	34.1	19.6	11.9
1883.	4,471,548	21,200	106,269	86,576	66,774	4.98	32.2	19.2	11.7
1884.	4,435,528	21,183	106,278	87,124	59,488	4.98	32.6	19.4	11.5
1885.	4,401,508	21,377	106,501	86,713	68,014	4.90	32.2	18.4	12.6

1888.	4,302,448	21,560	106,567	86,599	59,584	4.99	32.8	16.9	10.6
1889.	4,269,428	21,583	107,061	86,328	76,477	4.93	32.6	17.2	10.5
Ten-year Average, 1880-89.		21,245	107,378	86,621	60,671	4.88	32.7	18.9	10.1
1890.	4,236,408	20,880	101,254	86,590	61,213	4.96	32.4	18.3	10.1

There are 2,613 Local Registration Officers holding office directly under the Department or who have entered into bonds with the Registrar-General for the due discharge of their duties. During the year, 1890, 590 cases of vacancies or appointments were dealt with.

I append a table showing the number of Searches, &c., since the commencement of the Acts for the Registration of Births and Deaths and of Roman Catholic Marriages in

\* See page 42.

1864. It will be observed that the steady increase in the number of searches and in the number of certified copies issued noted in recent years was more than maintained in 1860.

TABLE II.—NUMBER OF SEARCHES made; number of CERTIFICATES issued, and Amount received as FEES for SEARCHES, &c., at the GENERAL REGISTRY OFFICE, DUBLIN, during the 27 years 1844-60.

YEAR.	Annual Number of Searches made in the Registry.	Annual Number of Certificates.	Amount received as Fees for Searches, &c., and paid into Her Majesty's Exchequer.	YEAR.	Annual Number of Searches made in the Registry.	Annual Number of Certificates.	Amount received as Fees for Searches, &c., and paid into Her Majesty's Exchequer.

1857,	746	206	48 8 0	1857,	381	545	307 4 0
1858,	773	213	28 12 0	1858,	349	543	346 8 0
1859,	804	203	24 12 0				

During the year 669 cases were reported of offences against the Acts administered by this Department. On careful inquiry into the circumstances, in 239 cases prosecutions were ordered to be instituted against the offenders. In 122 of these the parties were convicted and punished, in 70 the proceedings were withdrawn, the parties (in most instances) paying the costs of court and complying with the law, in 19 cases the summonses were dismissed, while in 18 instances the cases have not yet been heard in court.

The cases dealt with included the following offences:—Neglect to register Births, neglect to register Deaths, neglect to furnish Certificate of Marriage, failure of Coroner to furnish Certificate of Inquest; giving false information as to age at death, as to cause of death, and as to duration of illness previous to death; issuing false Medical Certificate of Cause of Death; giving false information as to Births, viz.—registering illegitimate children as legitimate, and misrepresenting date of birth; burying two bodies in one coffin without notice to the Registrar, &c.

The administration of the legal work of the office is, as mentioned in my Report for 1859, entrusted to Mr. Matheson, whose detailed statement of the business transacted will be found at page 185.

The following two cases appear to call for special notice:—

V. C. was prosecuted at the Metropolitan Police Court, under Sec. 30 of the 43 & 44 Vic. cap. 13, for (1) wilfully making and forging false Certificates of the Cause of Death in the cases of two children; and (2) for giving same as true to the mother of the deceased children. He was convicted and fined.

P. M. was prosecuted at the Metropolitan Police Court, under Sec. 13 of the 43 & 44 Vic. cap. 13, for failing to deliver to the person who buried the bodies the notice required by that Section of the fact that the coffin contained more than one body. He was convicted and fined, with costs.

The foregoing cases illustrate the means employed by unscrupulous persons to falsify registers, with the view of securing some small pecuniary advantage. In the first case the life of one of the children was insured, in the second the object appears to have been to defraud the Cemetery Authorities out of a burial fee. The former case in view of recent legislation for the protection of children, and the recent discussions regarding child life insurance is a sample of how the frail lives of delicate children may be tampered with and a pecuniary advantage gained.

During the year a most important addition was made to the books printed for the use of those engaged in the administration of the department, but in this case the work possesses not only an official but general literary interest. The publication referred to is entitled "Variations and Synonyms of Surnames and Christian Names in Ireland." The following extract from the first chapter of the book gives a very good idea of the scope of this interesting work which has been compiled by Mr. Matheson who has devoted a vast amount of valuable time, labour, and learned research to its compilation:—

"Our National Indexes of Births, Deaths and Marriages for the last twenty-six years, probably contain almost all the surnames in use in this country, but the information is necessarily scattered over many volumes, and the task of presenting in a complete and readable form the surnames of the population yet remains to be accomplished."

"Apost from the official purpose for which they have been prepared, the Indexes form a most interesting study. Like the figures in the kaleidoscope, names are continually changing, old names dropping out and new ones appearing."

"In addition to our Celtic, Anglo-Saxon and Norman surnames, we find Highland Gaelic names, represented by "MacDonald," "MacGregor," "MacIntosh." Welsh names are found such as "Morgan," "Richard," "Apjohn." Danish names appear as "Dowdall," "Drangoo," "Gould," "Coppinger." There are many Huguenot names as "La Touche," "Du Bedet," "Lefray," "Debecquer," "Le Faun," "Drelincourt," "Donkraen," "Commelin," "Ridout," "De Bloquiere." Italian names are represented as "Bassi," "Copp," "Cassiani." We have various German Palatinate names as "Bovensinn," "Delmeyer," "Switzer," "Doops," "Tecky," "Shire" and "Modder." Jewish names are found, such as "Cohen," "Levi," "Aaron," and the Indexes are now showing the result of the recent migration to this country of Jews from Russia in such names as "Rabinovitch," "Weiner," "Makofsky," "Hirschberg," "Stippel," "Bessin," "Winstock," "Greenberg," "Meissell," "Shukowsky," "Coplan," "Wachman," "Wederofsky," and "Fridberg."

"None but those actually engaged in registration work can have any idea of the practical difficulties which are encountered by persons searching the Indexes, owing to the great variations in names in Ireland."

"These variations are not only in spelling and form, but entirely different names are used synonymously by the same person or members of the same family."

"Many of these cases are direct translations of Irish names into English, or vice versa, while in others they are equivalents, modifications, or corruptions of them."

"In a country where two different languages are spoken, it might be expected some such cases would occur, but in Ireland the practice is much more widespread than is commonly supposed."

"In addition to the changes attributable to the difference of languages, time has a powerful effect in altering names, which have also a tendency to assume various forms in different districts."

"Illiteracy also operates in corrupting names, while they are also frequently varied in spelling and form at pleasure."

## MARRIAGES.

I regret to state that in 31 cases returns relating to a portion of the year 1890 have not yet been furnished by the clergy of the Church of Ireland, and in 8 instances by the Presbyterian clergy connected with the General Assembly. The number of marriages celebrated in these churches is known to have been small, and would not appreciably affect the general statistical results for Ireland, but nevertheless it is unsatisfactory to have to notice even any omissions to comply with Sec. 65 of 7 & 8 Vic., cap. 81, under which these returns are required from the clergy.

The number of Marriages registered during the year is 20,990, being equal to 1 in every 223, or 4·6 per 1,000, of the estimated population,\* a rate which is .07 under that for the previous year, but .19 above the average for the ten years 1880-89.

Of the 20,990 Marriages registered during the year 1890, 14,297 were between Roman Catholics, 3,556 were celebrated according to the rites and ceremonies of the Church of Ireland; 2,251 were in Presbyterian Meeting-houses; 432 in "Registered Buildings" belonging to various religious denominations; only 445 by civil contract in the Registrars' offices; 6 were according to the usages of the Society of Friends; and 3 according to the Jewish rites.

Of the 3,556 Marriages according to the rites of the Church of Ireland, 58 were by special licence, 2,935 by licence, 448 after the publication of banns, 14 on Registrar's certificate, and in 51 instances there was no information afforded as to which of the foregoing methods was adopted.

\* Throughout this Report the rates for the total of Ireland are based on the estimated population in the middle of the respective years.

TABLE III.—Marriages registered in Ireland in 1890 and each of the previous ten years, according to the modes of celebration; with the rate per 1,000 of the population represented:—

YEAR.	Marriages registered under 7 and 8 Tit., cap. vi.							Roman Catholic Marriages.	Total Marriages Registered.	Rate per 1,000 of estimated corresponding Population represented by

During the year 1890 there were issued by the Registrars 716 Licences for Marriage in Registered Buildings and in the Registrars' offices.

The number of Marriage Licences issued by the licensing Ministers of the several Presbyterian bodies is given in the following summary:—

Presbyterian.							Number of Licensing Ministers on 31st December, 1890.	Number of Registered Ministers on 31st December, 1890.	Number of Licences issued.
1. General Assembly of the Presbyterian Church in Ireland, . . . . .							118	662	8,348
2. Scotch Presbyterian Church of Ulster, . . . . .							8	18	65
3. Presbytery of Antrim, . . . . .							4	8	12
4. United Presbyterian Church of Ireland, . . . . .							2	2	1
5. Northern Presbyterian Church of Antrim, . . . . .							8	8	7
Total, . . . . .							218	680	8,354

There being no civil restrictions as to the time or place for celebrating marriages between Roman Catholics in Ireland, a registration of the churches and chapels of the Roman Catholic Church is not necessary for the purposes of this office; but with reference to other religious bodies, a record is kept of the places of Divine worship in which marriages may lawfully be solemnized without special licence, and from this it appears that, on the 31st December, 1890, there were 1,494 churches and chapels of the Church of Ireland, 600 registered Presbyterian Meeting-houses, and 855 "Registered Buildings" belonging to various religious denominations. Compared with the previous year, these numbers show a decrease of 1 as regards the Church of Ireland, an increase of 1 in the number of Presbyterian Meeting-houses, and an increase of 5 "Registered Buildings."

The following statement shows the several religious bodies having "Registered Buildings" in 1890:—

Denomination.	No. of Places of Worship.	Denomination.	No. of Places of Worship.	Denomination.	No. of Places of Worship.
Methodists, . . . . .	312	Salvation Army, . . . . .	7	United Original Seceders, . . . . .	1
Reformed Presbyterians, . . . . .	58	Christian Brethren, . . . . .	6	"Protestant Dissenters," . . . . .	1
Independents, . . . . .	26	Evangelical Union, . . . . .	2	Non-Soberning Christians, . . . . .	1
Baptists, . . . . .	30	Non-Subscribing Unitarians, . . . . .	1	"The Catholic Apostolic Church," . . . . .	2
Seceders, . . . . .	10	Jews, . . . . .	2	Independent Protestants, . . . . .	1
United Presbyterians, . . . . .	9	Unitarians, . . . . .	1	Total, . . . . .	855
Methodists, New Connexion, . . . . .	7	Congregationalists, . . . . .	1		
Moravians, or United Brethren, . . . . .	7				

As more than a moiety of the annual number of Roman Catholic marriages in the provinces of Munster and Connaught are celebrated between Christmas and Shrovetide, the marriages registered in Ireland during the first quarter of the year always largely outnumber those in any of the other quarters. In 1890, the numbers recorded were—in the first quarter 6,401; in the second, 4,994; in the third, 4,824; and in the last, 4,771.

The marriages of bachelors and spinsters constitute 86·8 per cent. of the total; those of widowers and spinsters 8·4 per cent.; of bachelors and widows 2·8 per cent.; and of widowers and widows 2·2 per cent. Thus, 11 in every 100 of the men married were widowers, and 5·0 per cent. of the women were widows; and in 13 instances in every 100 marriages one or both of the contracting parties had been in the married state before.

TABLE IV.—Showing by QUARTERLY PERIODS, the number of MARRIAGES registered in Ireland in each of the eleven years 1880-90, and the average number for the ten years 1880-89, distinguishing the number of Roman Catholic marriages registered under the 26 & 27 Vic., cap. 90, and of Protestant and other marriages under the 7 & 8 Vic., cap. 81:—

YEAR.	MARRIAGES.

A complete registry of the exact ages of the persons married would be valuable from many points of view; hence it is matter for regret that in the great majority of instances the ages are not recorded. The requirements of the law are technically complied with by the entry in the age column of "minor" or of "full age," as the case may be, and there seems to be a general and increasing inclination to take advantage of this circumstance, as in 1890 the ages of both parties were specified in only 4,438 instances, being little more than one-fifth of the total number of marriages. In the year 1885, when 30,802 marriages were registered, the ages of both parties were given in 13,810 instances.

Of 20,990 men married during the year, 423, or 2·02 per cent., were minors; and of the women married, 1,837, or 8·75 per cent., were under age. These proportions are considerably below the averages for the preceding ten years.

The highest proportion of husbands (2·71 per cent.) married under age in 1890, was in the province of Ulster, and in that province there was also the highest per-cent-age of wives (9·83), not of full age.

It may be added that the per-cent-age of persons married in Ireland who were under age is very far below the corresponding rates in England and Scotland.

The signatures of the contracting parties in the marriage registers or certificates afford a rough test of the progress of elementary education. In the year 1890, 16,717, or 79·6 per cent., of the husbands, and 16,612, or 79·1 per cent., of the wives, wrote their names, and the remainder signed by marks.

These figures, though still leaving much to be desired, contrast hopefully with the corresponding results eleven years since, the per-centages of persons married in 1880 who wrote their names being—men 73·2, and women 69·1.

As usual, the most favourable results appear in Leinster, and the least satisfactory in Connaught, the number of those married who wrote their names varying from 83 in every 100 men and 85 in every 100 women, in the former province, to 72 per cent. of the men and 74 per cent. of the women in the latter.

In 9,380 instances, both of the parties married signed the register by "mark," and in 3,991 cases the register was thus signed by either the husband or the wife, so that in 6,321 instances, or 80·1 per cent. of the total number of marriages, one or both of the parties signed by mark; and in 14,669 instances, or 69·9 per cent., both parties wrote their names.

The number of marriages registered in each of the eleven years 1880-90; the proportion per cent. of persons married who wrote their names in the registers; of minors, of widowers, and of widows are given in the following Table for Ireland, and for each of the four provinces.

TABLE V.—Showing as regards the Marriages in Ireland and in each of the Four Provinces during the years 1880-90, the proportion per cent. of Persons who signed their Names, of Persons not of Full Age, and of Re-marriages. The figures for the years 1880-84 refer to Registration Provinces; those for 1885-90 to the Provinces Proper.

In proportion to the estimated population at all ages, the registered marriages were most numerous in the province of Ulster, in which, however, the rate was only 3·0 per 1,000 of the population (unrevised) in 1891; Leinster comes next, with 4·9 per 1,000; Munster third, with 4·0 per 1,000; and Connaught last, the rate being 3·2 per 1,000.

The highest rate for any county was 7·2 per 1,000 of the population (unrevised) in 1891, which was the marriage rate for Antrim; and the lowest 2·8 per 1,000, for Cavan. Between these, the most favourable were 6·6 for Dublin, and 5·2 for Down; and the least so 2·9 for Galway, and 3·1 for Mayo.

### BIRTHS.

The number of births registered during the year 1890 was 105,254—54,250 boys and 51,004 girls, or 106·4 of the former to every 100 of the latter—the rate afforded in proportion to the estimated population being 1 in 44·5, or 22·4 per thousand, which is 1·3 under the low average rate for the ten years, 1880-89, and less than the rate for any of those years.

Of the 105,254 children whose births were registered in Ireland during the year 1890, 102,427, or 97·3 per cent. were legitimate, and 2,827, or 2·7 per cent., were illegitimate: these were also the average percentages for the preceding 10 years. It is unnecessary to say that these results compare very favourably with the returns for most other countries.

Of the children born in wedlock during the year, 52,774 were males, and 49,553 females, being 106·3 of the former to every 100 of the latter, and of the illegitimate children 1,476 were males, and 1,351 females, or 109·3 boys to 100 girls.

Comparing the provinces, we find that the percentage of children born in Ulster, who were illegitimate, was 4·0; in Leinster, 2·5; in Munster, 2·2; and in Connaught, 0·8.

TABLE VI.—The Percentage of Legitimate and of Illegitimate Births registered in Ireland during the years 1886-90, by Provinces.

Provinces.	Proportion per cent. of Legitimate Births.					Proportion per cent. of Illegitimate Births.				
	1886.	1887.	1888.	1889.	1890.	1886.	1887.	1888.	1889.	1890.
IRELAND, . . .	97·8	97·9	97·3	97·9	97·8	2·7	2·9	2·9	2·9	2·7
LEINSTER, . . .	97·8	97·7	97·6	97·6	97·6	2·5	2·6	2·6	2·6	2·6
MUNSTER, . . .	97·9	97·8	97·8	97·6	97·6	2·5	2·6	2·6	2·6	2·5
ULSTER, . . .	95·9	95·6	95·5	96·0	96·0	4·0	4·0	4·3	4·4	4·0
CONNAUGHT, . . .	95·2	95·4	95·5	95·2	95·2	0·7	0·7	0·7	0·7	0·6

The respective total birth-rates for the provinces in 1890 were—Leinster, 22·1 per 1,000 of the population in 1891; Munster, 22·0; Ulster, 23·1; and Connaught, 21·8.

The four counties having the highest rates are Antrim, 27·5 per 1,000 of the population in 1891; Dublin, 25·7; Down, 24·8; and Kerry, 24·2. Those with the lowest rates are—Monaghan, 18·4; Longford, 18·9; Meath, 19·0; and Queen's, 19·2, respectively.

Of the total births, 53.3 per cent. were registered in the first six months of the year (181 days), and 46.7 per cent. in the second half of the year (184 days).

The number registered in the first quarter was 27,525 ; in the second, 23,614 ; in the third, 25,833 ; and in the fourth, 23,282.

---

#### **DEATHS.**

The deaths registered during the year amount to 85,850, being equal to 1 in 54.6 or 18.3 per 1,000 of the estimated population. The deaths of males number 42,140, and those of females 43,710, the former being equal to 18.3 in every 1,000 males living, and the latter representing 18.3 per 1,000 females.

As already stated the death-rate (18.3) was slightly over the average rate for the preceding ten years, which was 18.2 per 1,000.

As heretofore, very many of the Registrars furnished at the close of each quarter valuable notes on the sanitary condition of their respective districts. These notes were embodied in the Quarterly Returns issued from this department, and emanating as they did, from gentlemen qualified to speak decisively on the subject, it is to be hoped that they received the serious attention of the various Local Authorities intrusted with the administration of the Public Health Acts.

With respect to the death-rates for the four provinces, the rate for Connaught is only 14.7 ; that for Munster is 17.4 ; for Ulster, 18.8, and for Leinster, 20.3 per 1,000 of the population in 1891.

Of the thirty-two counties, the four having the lowest registered mortality are—Sligo, 13.9 per 1,000 ; Mayo, 13.9 ; Cavan, 14.8 ; and Kerry, 15.0.

Those in which the rate was highest are—Dublin, 24.3 ; Antrim, 22.9 ; Kilkenny, 20.2 ; and Carlow, 19.7.

The deaths registered in the first half of the year generally outnumber those in the second. In 1890, 58.5 per cent. of the total deaths were registered in the six months, January to June inclusive, and only 41.5 per cent. in the remaining six months of the year.

The annual rates represented by the deaths registered in each quarter are as follow:—First quarter, 24.3 per 1,000 of the population ; second, 18.3 ; third, 14.3 ; and fourth, 16.1.

From the Table on pp. 168–177 it will be seen that, of the 85,850 deaths registered during the year, 2,126 took place in Infirmaries and General and Special Hospitals ; 940 in Public Lunatic Asylums ; 10,477 in Workhouses and Workhouse Hospitals ; and 72,307 were of persons who died "At their Own Homes, &c." As in former Reports a Table (see pages 178–179) is given showing like information for those Registrars' Districts in which the principal Urban Sanitary Districts in Ireland are situated.

The deaths in "Infirmarys and General and Special Hospitals" constitute 2·5 per cent. of the total number, the percentages for the four provinces varying from 0·3 in Connnaught to 6·2 in Leinster. Twelve per cent. of the deaths registered occurred in Workhouses or Workhouse Hospitals, the respective percentages for the provinces being—Leinster, 13·8; Munster, 18·2; Ulster, 7·7; and Connnaught, 9·9.

TABLE VII.—Showing, by Quarterly Periods, the number of Births and Deaths registered in Ireland in each of the eleven years, 1880-90, and the average number for the ten years, 1880-89.

**L.—SPECIFIC FEBRILE OR ZYMOTIC DISEASES.**

The number of deaths from Specific Febrile or Zymotic diseases registered during the year 1890 was 7,892, or 165 in every 100,000 of the estimated population, being 1,210, or 26 per 100,000 persons, over the number for the preceding year, but considerably below the average for the ten years, 1880-89.

Of the 7,892 deaths from zymotic diseases 4,203, or 53·3 per cent., were amongst children under 10 years of age.

The deaths from the eight principal zymotic diseases\* registered during 1890 form 6.4 per cent. of the deaths from all causes, and are equal to 118 in every 100,000 persons living; the average annual mortality from the same diseases in the preceding 10 years represented 8.6 per cent. of the average number of deaths from all causes, and was equal to 156 deaths in every 100,000 of the estimated mean population.

\* Small-pox, Measles, Scarlet Fever, Diphtheria, Whooping-cough, Fever, Diarrhoea (and Dysentery), and Cholera.

TABLE IX.—Showing the Number of Deaths from the Principal Febrile or Zymotic Diseases registered in Ireland during the year 1850, and the Average Annual Number for the ten years 1850-59; with the Number registered in the several Provinces during each of the six years 1855-59; and the Rates per 100,000 of the Population.\*

Small-pox.—No deaths from small-pox have been registered in Ireland during either of the last two years. The average annual number of deaths from this disease for the ten

\* The rates for the total of Ireland are based on the estimated population in the several years, those for the Provinces on the population according to the Census, the rates for the five years, 1855-9, being founded on the 1861 population, and those of 1850 on the population (unrevised) by the Census of 1851.

years 1880-89 was 63; but nearly all occurred in the first three years of the decade. In 1883 there were but 16 fatal cases of the disease recorded; in 1884, one; in 1885, 4; in 1886, 2; in 1887, 14; and in 1888, 3.

**Measles.**—Deaths from measles, which had fallen from 1,935 in 1888 to 574 in 1889, rose last year to 726, but this number is 247, or 25 per cent. below the yearly average for the ten years 1880-89. The 726 deaths were distributed through the provinces as follows:—155 in Leinster (including 96 in the unions of Dublin North and Dublin South); 65 in Munster (including 33 in Waterford union); 434 in Ulster (of which 372, or more than one-half of the total number for Ireland, occurred in Belfast); and 72 in Connaught (including 43 in Galway union).

**Scarlet Fever.**—There were but 319 deaths from this disease registered, being the lowest number in any year since registration was established in 1864; 925, or 74 per cent. below the average for the ten years 1880-9, and 138 under the low number for the last year of that period. Of the 319 deaths registered last year, 33 occurred in Leinster, 143 in Munster (including 83 in the county of Tipperary), 113 (of which 40 were in Belfast union) in Ulster, and 30 in Connaught.

**Diphtheria.**—Deaths from diphtheria, which had fallen from 447 in the year 1888 to 358 in the following year, fell last year to 346, but the number is 3 over the average for the ten years 1880-9. The 346 deaths consist of 69 in Leinster (including 8 in the North, and 15 in the South Dublin union), 75 in Munster (16 of which were in Cork union), 183 in Ulster (including 10 in Armagh union, 12 in Ballymena union, 51 in Belfast union, 12 in Lisburn union, 23 in Londonderry union, and 11 in Newtownards union), and 19 in Connaught. In Ulster the rate represented by deaths from diphtheria was 11·3 per 100,000 of the population, and in Connaught, 2·6.

**Whooping-cough.**—The number of deaths from this disease, which had risen from 1,259 in 1888 to 1,681 in 1889, amounted last year to 1,493, or 31·8 per 100,000 of the population, against an average rate of 30·7 per 100,000 for the ten years 1880-9. The 1,493 deaths in 1890 were distributed as follows:—398 in Leinster (including 80 in the North, and 93 in the South Dublin union), 218 in Munster, 723 in Ulster (of which 314 were in Belfast union, and 79 in Londonderry union), and 152 in Connaught. The respective rates for the four provinces were—Leinster, 33·3 per 100,000 of the population in 1891; Munster, 18·6; Ulster, 44·8; and Connaught, 21·0.

**Fever.**—The total number of deaths from the several forms of continued fever was 1,477, being 100 under the number for the preceding year, and 493 below the average for the ten years 1880-89. The rate represented by the deaths for last year was 31·5 per 100,000 of the population, against an average of 39·7 for the preceding ten years, showing a diminution in the mortality rate equivalent to a decrease of 20 per cent. The deaths from "fever" in Leinster were equal to 34·4 per 100,000 of the population in 1891; in Munster the rate was 31·4 per 100,000; in Ulster, 30·0; and in Connaught, 29·9.

The 1,477 deaths from "fever" consist of 391 from typhus (being 32 over the number for 1889, but considerably below the average for the ten years 1880-9), 855 from enteric fever (being 113 under the number for 1889, but slightly above the average), and 251 from simple continued and ill-defined fever. Enteric fever was again prevalent in Belfast and Dublin, but was not as fatal as during the preceding year, the respective numbers for Belfast union being 236 deaths in 1889, and 190 in 1890, and for the two unions of Dublin North and Dublin South 231 in 1889, and 168 in 1890.

In proportion to the living at the same age, "fever" was most fatal at the age-periods 20 and under 25 years and 25 and under 30, for the former of which the rate was 43·02 per 100,000 and for the latter 43·71, and least so amongst persons aged 75 and upwards, the rate being 16·36 per 100,000.

TABLE X.—Showing for the year 1890 the Deaths from the several forms of Fever at each Age-Period, with the proportion to the number of the living at each Age represented thereby.

*Erysipelas.*—The number of deaths from erysipelas was 156, being a decrease of 31 as compared with that for the preceding year, and 97 under the average for the ten years 1880–9.

*Puerperal Fever.*—There were only 252 deaths from this disease registered, being 83 below the average for the preceding ten years, and 16 under the number for the year 1889.

*Influenza.*—The epidemic of influenza, so widespread throughout Europe, extended to Ireland with the result that the deaths from this disease and its complications registered during the year 1890 amounted to 1,712, (866 males and 846 females), or 3·6 per 10,000 of the population according to the Census of 1891. The 1,712 deaths comprise 483 of children under 10 years of age, and 678 of persons aged 55 years and upwards. In the province of Leinster the influenza death-rate was 2·6 per 10,000 of the population; in Munster, 8·6; in Ulster, 3·4; and in Connacht, 5·2. The county rates range from 1·2 per 10,000 in the King's County to 6·7 in Mayo.

The Table (XL) on the opposite page shows, by Sexes and Age-Periods, the distribution of the deaths from influenza through the several counties.

TABLE XI.—Showing, by Provinces and Counties, the number of Deaths from Influenza at each of five Age-Periods registered in Ireland during the year 1890, with the rate per 10,000 of the population represented by the deaths at all ages.

*Diarrhoea and Dysentery.*—The entries under this heading show that there was a greatly diminished mortality from these diseases, the number of deaths for the year being 1,121, or 23·9 per 100,000 of the estimated population, against an average of 1,593, or 22·1 per 100,000 living for the preceding ten years.

The rate for Leinster in 1890 was 25·8 per 100,000 of the population in 1891; for Munster, 24·0; for Ulster, 28·1; and for Connaught, 19·8. Of the 309 deaths from diarrhoea and dysentery in the province of Leinster, 174 occurred in one or other of the two unions of Dublin North, and Dublin South; and of the 454 deaths in Ulster, 209 were registered in Belfast union.

*Simple Cholera.*—There were but 41 deaths ascribed to this disease, viz.:—8 in Leinster, 18 in Munster, and 21 in Ulster.

Five males and 2 females died from *Hydrocephalus*.

## II.—PARASITIC DISEASES.

There were only 64 deaths caused by diseases of this class.

## III.—DIETETIC DISEASES.

The deaths from dietetic diseases number 148; they comprise 143 from intemperance, 35 of which (33 males and 2 females) were caused by delirium tremens, and 108 (91 males and 17 females) come under the head of chronic alcoholism. The number of deaths from intemperance registered in the preceding year also was 148.

## IV.—CONSTITUTIONAL DISEASES.

From diseases termed "constitutional" there resulted 15,910 deaths (7,583 males and 8,327 females), affording a rate of 1 in 5·4 of all the deaths, and equal to 339 in every 100,000 of the population.

*Phthisis or Pulmonary Consumption* proved fatal in 10,176 instances (4,841 males and 5,335 females) being equal to 217·0 in every 100,000 persons; the average annual number for the previous ten years was 10,426, or 210·3 per 100,000 of the estimated mean population.

As heretofore, Leinster and Ulster yield the highest rates, and Connaught the lowest. The rates for the four provinces are as follow:—Leinster, 251 per 100,000 of the population; Ulster, 235; Munster, 197; and Connaught, 148.

Of the 3,802 deaths from phthisis in Ulster, 1,143 occurred in Belfast union, the number being equal to 395 per 100,000 of the population in 1891, and the 3,004 fatal cases of the disease in Leinster comprise 1,252, or 358 per 100,000 of the population, registered in the unions of Dublin North and Dublin South.

Of the total number of deaths from phthisis in Ireland, 7,443, or 73 per cent., were of persons between 15 and 45 years of age.

*Mesenteric Disease.*—The deaths from mesenteric disease number 918—458 males and 460 females.

*Gout.*—Only 29 deaths from gout were registered (19 males and 10 females).

*Cancer.*—There were 2,145 deaths (938 males and 1,207 females) tabulated under this heading, against an average of 1,967 for the ten years 1880-9.

The following Table shows, by Sexes and Age-periods, the deaths from Cancer registered during the year 1890, arranged according to the part of the body affected by the disease, in so far as that information was contained in the Returns; also the number of deaths to 100,000 of the living at same age. In 234 instances the organ or portion of the body affected was not stated, and it will be observed that 581 of the classified cases were deaths from cancer of the stomach, and that 236 females died from cancer of the breast, and 166 from cancer of the uterus. The Table shows also the total deaths from cancer in each of the ten years, 1880-9, arranged by Age-periods.

\* Including 11, penis; 16, bladder.

## V.—DEVELOPMENTAL DISEASES.

The deaths in this class amount to 19,887, of which 18,901 (8,504 males and 10,397 females), or 22·0 per cent. of the deaths from all causes, were ascribed to "old age." Of the remaining 486 deaths, 404 are tabulated under the head of "premature birth"; 15 were caused by atelectasis, 16 by cyanosis, 33 by spina bifida; &c.

## VI.—LOCAL DISEASES.

The number of deaths from "local diseases" registered amounted to 34,634 (17,882 males and 16,802 females), or 40·3 per cent. of the deaths from all causes.

*Diseases of the Nervous System.*—From this group of diseases there resulted 7,628 deaths—4,007 males and 3,621 females. They include 2,581 from convulsions (nearly all children), 1,386 tabulated under the head of hemiplegia, brain paralysis; 1,114 from apoplexy; 850 from inflammation of the brain or its membranes, 326 from epilepsy, 371 from insanity (general paralysis of the insane), 11 (4 males and 7 females) from chorea or St. Vitus's dance, 228 from softening of the brain, &c.

*Diseases of the Circulatory System.*—Diseases of the circulatory system caused 5,568 deaths—2,832 males and 2,736 females.

*Diseases of the Respiratory System.\**—Although not so low as in the year 1889, the mortality from these diseases last year was below the average, the number of deaths registered being 14,258 (7,335 males and 7,023 females), or 306·2 in every 100,000 of the population, against an average of 15,466 or 311·9 per 100,000 of the estimated mean population for the ten years 1880-89, during which period the annual numbers ranged from 14,046 in 1884 to 16,936 in 1881. The respective rates for the Provinces, in 1880, are Leinster, 360·0 per 100,000 persons; Munster, 306·0; Ulster, 306·8; and Connaught, 209·1.

\* Exclusive of Phthisis, or Pulmonary Consumption, for which see "Constitutional Diseases."

Of the 14,358 deaths from those causes 9,507 (4,536 males and 5,031 females), resulted from bronchitis; 3,300 (2,006 males and 1,294 females) were from pneumonia or inflammation of the lungs; 640 from croup; 184 from asthma and emphysema; 177 from pleurisy; 110 from laryngitis, &c.

*Diseases of the Digestive System.*—These diseases caused 4,267 deaths (2,190 males and 2,077 females), including 432 from enteritis or inflammation of the bowels; 412 from peritonitis or inflammation of the covering of the bowels; 419 from ileus or obstruction of the bowels; 251 from ulceration of the intestines; 150 from hernia; 9 (all males) from fistula; 223—138 males and 85 females—from cirrhosis of liver; &c.

*Diseases of the Urinary System.*—To the various affections of this order of diseases 1,623 deaths (1,135 males and 488 females) were ascribed. Of these deaths, 605 (346 males and 259 females) were from Bright's disease, 183 from acute nephritis or inflammation of the kidneys; 18 from isthuria or suppression of urine; 18 from stone in the bladder; 55 from uremia, &c.

The remaining deaths from Local Diseases comprise 54 from *Diseases of the Lymphatic System and of Ductless Glands*; 598 from Diseases of the Reproductive System (including 158 from diseases of the Organs of Generation, and 440 from the Accidents of Childbirth), 269 from *Diseases of the Organs of Locomotion*; and 220 from *Diseases of the Integumentary System*.

## VII.—VIOLENT DEATHS.

The number of violent deaths registered during the year is 1,791 (1,233 males and 558 females), or 35·2 in every 100,000 of the population, being 0·3 under the average rate for the ten years 1880-89. Accidents or negligence caused 1,593 of these deaths (including 667 from fractures and contusions, 310 from burns or scalds; and 320 from drowning); there were 83 cases of homicide (murder and manslaughter), and 115 of suicide. In the preceding year there were 117 homicides and 121 suicides.

*Inquests.*—There were 2,041 inquests reported to the Registrars during the year 1890, being 1 inquest to every 42 deaths registered.

---

## AGES.

Deaths of infants under 1 year old numbered 9,975, being equal to 9·5 per cent. of the number of births registered.

Amongst children under 5 years of age 17,020 deaths occurred—a mortality equal to 32·6 in every 1,000 of the estimated number of the living at that age. Of these, 9,078 were boys and 7,942 girls; the former number representing 35·5 in every 1,000 boys, and the latter 29·9 in every 1,000 girls under 5 years old.

The deaths of persons aged 65 years and upwards are equivalent to 10·4 per cent. of the living at that age.

Among the deaths registered are 630 of persons stated to have been aged 95 years or upwards—293 males and 337 females; of these 163 (61 males and 102 females) were returned as having been 100 years or upwards. In the absence of public records for remote periods, absolute verification of the ages of very old persons is not obtainable, but secondary inquiries having been made as regards persons returned during the year 1890 as centenarians, it was found, in almost every instance, that so far as the Registrars could ascertain the age was correctly stated.

---

## EMIGRATION.

According to the Returns obtained by the Royal Irish Constabulary and the Metropolitan Police, who acted as enumerators at the several Irish seaports, the number of emigrants who left Ireland during the year 1890 amounted to 61,313; of these 31,361 were males and 29,952 were females. Of the whole number, 10,415 were from the Province of Leinster; 23,554 from Munster; 14,277 from Ulster; and 13,957 from Connaught.

Of the total emigrants from Ireland in 1890, 10·2 per cent. were under 15 years of age; 81·0 per cent. were between 15 and 25 years old; 8·7 per cent. were 35 or upwards; and in 41 instances, or 0·1 per cent., the ages were not specified.

### PRICES OF PROVISIONS, AND PAUPERISM.

The average price of the 4 lb. loaf in Dublin was 6d.<sup>a</sup>. Oatmeal (1st quality) averaged 15s. 3d. per cwt. in Dublin, being 1s. 8d. over average price for 1889; the average prices of potatoes in Dublin ranged from 2s. 7d. to 3s. 3d. per cwt., against 2s. 5d. to 3s. 3d. in 1889; and those of beef from 50s. 6d. to 62s. per cwt., against 48s. to 61s. in 1889.

TABLE XIII.—AVERAGE PRICES IN DUBLIN OF BEEF, OATMEAL, POTATOES, AND BEEF, DURING THE YEARS 1880-90, AND THE AVERAGE NUMBER OF PERSONS IN IRELAND RECEIVING IN-DOOR AND OUT-DOOR RELIEF ON SATURDAYS IN THESE YEARS; ALSO THE AVERAGE PRICES OF PROVISIONS AND THE AVERAGE NUMBER OF PERSONS IN RECEIPT OF RELIEF DURING EACH QUARTER OF THE YEAR 1890.

<sup>a</sup> Prices for the years 1880-2, and first two quarters of 1886, were derived from Returns furnished by Messrs. Maudlin & Co., and for the third and fourth quarters of 1886 and for the years 1888 and 1890, from Returns received from "Bullock, Linton, and Sons, Jenkins & Co. (for Limerick, Meath, and O'Brien, Limerick)—the prices quoted for these two firms including delivery.

<sup>b</sup> Compiled from Returns furnished by the Local Government Board.

Surveying the period covered by the several Tables in this Report, i.e., 1890, and the ten years preceding, it is found that beef was lowest in the year 1887, when the average prices ranged from 44s. to 52s. 6d. per cwt.; oatmeal was cheapest in 1889, when the average price was 1s. 8d. per cwt.; and potatoes, in 1888, when the average range of prices was from 2s. 2d. to 2s. 9d. per cwt. The highest average price of oatmeal was 17s. 6d. in 1884 and 1885; the highest range for potatoes, 4s. 2d. to 7s. 4d. per cwt. in 1880, and for beef, 66s. 6d. to 77s. per cwt. in 1883.

From Returns, for which I am indebted to the Local Government Board, it appears that the average number of workhouse inmates in Ireland on Saturdays during the year 1890 was 48,909, being 1,037 under the average for the preceding year; and that the average number of persons receiving out-door relief was 62,081, or 209 under the corresponding number for 1889.

### THE WEATHER.

The following particulars and those given on pages 22-41, which are inserted by the kind permission of the Editor of the *Dublin Journal of Medical Science*, have been

derived from Returns of Meteorological Observations taken in Dublin City during the years 1870-90, by J. W. Moore, Esq., M.D., F.R.C.P.L., F.R. MET. SOC.; and published in the Journal during the years 1890-91.

The mean Atmospheric Pressure has been obtained from daily readings of the barometer at 9 A.M. and 9 P.M., corrected and reduced to 32° Fahrenheit at the mean sea level. The Mean Temperature values have been deduced from the maximal and minimal readings of the thermometer in the shade. The Rainfall is that measured daily at 9 A.M. A rainy day is one on which at least one-hundredth (0·01) of an inch of rain falls within the twenty-four hours from 9 A.M. to 9 A.M.

The Mean Height of the Barometer during the year 1890 was 29·927 inches. The highest observed reading was 30·744 inches at 11 A.M. on February 23rd. The lowest observed reading was 29·693 inches, at 7·45 A.M. on January 23rd. The extreme range of atmospheric pressure was 2·051 inches compared with 1·940 inches in 1889.

The Mean Temperature of the year, deduced from the maximal and minimal readings of the thermometer in the shade was 49·8°. The highest reading was 74·8° on August 4th; the lowest reading was 24·1° on December 21st. The average mean temperature for the years 1870-89 calculated in the same way, was 48·6°. The mean temperature deduced from the daily readings of the dry bulb thermometer at 9 A.M. and 9 P.M. was 49·5°.

Rain fell on 200 days, including snow or sleet on 21 days, and hail on 23 days. The average number of rainy days in the years 1870-89 was 106·0. The total rainfall measured 27·562 inches, compared with an average of 27·963 inches in the twenty years 1870-89. During the first half of 1890 (January to June, inclusive) the rainfall was 13·413 inches on 94 days; during the second half (July to December, inclusive) 14·149 inches fell on 106 days.

As regards the Direction of the Wind, 730 observations were made during the year, with this result—N., 59; N.E., 41; E., 67; S.E., 61; S., 85; S.W., 119; W., 107; N.W., 96; Calms, 34.

I have the honour to be

Your Excellency's faithful servant,

THOS. W. GRIMSHAW,

*Registrar-General.*

GENERAL REGISTER OFFICE,  
CHARLEMONT HOUSE,  
Dublin, 23rd December, 1891.

**METEOROLOGICAL OBSERVATIONS**  
FOR EACH MONTH OF THE YEAR 1890.

By J. W. MOORE, Esq., M.D., F.R.C.P.L., F.R. MET. SOC.

(Extracted from the *Dublin Journal of Medical Science*.)

JANUARY.—January, 1890, proved a tempestuous, mild, and rainy month. Rough northward to westerly winds blew with little intermission, and frequently freshened into strong or violent gales, especially in the west of Ireland. Even in Dublin, eleven gales were recorded, some of them being downright tempests. Almost throughout the month atmospheric pressure was low over the Atlantic Ocean in the W., N.W., and N., high over central and southern Europe. On several occasions thunder and lightning accompanied the storms.

In Dublin the mean temperature ( $44^{\circ}5$ ) was much above the average ( $41^{\circ}4$ ); the mean dry bulb readings at 9 a.m. and 9 p.m. were  $44^{\circ}1$ . In the twenty-five years ending with 1889, January was coldest in 1881 (M. T. =  $32^{\circ}2$ ), and warmest in 1875 (M. T. =  $46^{\circ}6$ ). In 1867 the M. T. was  $35^{\circ}7$ , and in 1865 it was  $37^{\circ}8$ . In 1871 and in 1880 the M. T. was  $37^{\circ}9$ ; in the year 1870 (the "cold year") it was  $35^{\circ}3$ . In 1883, the M. T. was  $42^{\circ}1$ , and in 1889 it was  $42^{\circ}4$ . As a general rule, January in Dublin is not colder, but rather a shade warmer, than December. This is owing to the fall development in January of a winter area of low pressure over the Atlantic, to the north-westward of the British Isles, and to a resulting prevalence of S.W. winds in their vicinity. January, 1890, proved no exception to this rule, the M. T. being  $0^{\circ}7$  above that of December, 1889, ( $39^{\circ}8$ ).

The mean height of the barometer was 29.760 inches, or  $0^{\circ}141$  inch below the average value for January—namely, 29.881 inches and as much as  $0^{\circ}110$  inch below the mean for January, 1889—namely, 30.150 inches. The mercury rose to 30.450 inches at 4 p.m. of the 29th, and fell to 29.693 inches at 7.45 a.m. of the 23rd. It had been lower in the early morning hours. The observed range of atmospheric pressure was, therefore, as much as  $1^{\circ}737$  inches—that is, a little over one inch and three-quarters. The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was  $44^{\circ}1$ , or  $0^{\circ}8$  above the value for December, 1889. Using the formula,  $\text{Mean Temp.} = \text{min.} + (\text{max.} - \text{min.}) \times .12$ , the value becomes  $44^{\circ}7$ , compared with a twenty-five years' average,  $41^{\circ}6$ . The arithmetical mean of the maximal and minimal readings was  $44^{\circ}5$ , compared with a 25 years' average of  $41^{\circ}4$ . On the 16th the thermometer in the screen rose to  $56^{\circ}8$ —wind, S.S.W.; on the 29th the temperature fell to  $31^{\circ}1$ —wind W.N.W. The minimum on the grass was  $24^{\circ}3$  on the same date. The rainfall was 2.975 inches, distributed over 21 days. The average rainfall for January in the twenty-five years, 1865-89, inclusive, was 1.260 inches, and the average number of rainy days was 17.3. The rainfall and the rainy days, therefore, were both considerably above the average. In 1877 the rainfall in January was very large—4.322 inches on 23 days; in 1869, also 4.258 inches full—on, however, only 18 days. On the other hand, in 1876, only .406 of an inch was measured on but 9 days; and in 1880, the rainfall was only .383 of an inch on but 8 days. In January, 1886, 3.244 inches of rain were measured on as many as 26 days, in 1887 ("the dry year"), 1.816 inches fell on 16 days, in 1888 1.247 inches on 9 days, and in 1889, 2.213 inches on 16 days.

A solar halo was seen on the 29th. Lunar halos were seen on the 7th and 27th. The atmosphere was foggy on each of the first two days, as also on the 27th. High winds were noted on 21 days, reaching the force of a gale on eleven days. Hail fell on the 18th, 19th, and 23rd, and snow or sleet on the 19th, 20th, 22nd, 23rd, and 28th. Temperature exceeded  $50^{\circ}$  in the screen on 17 days, compared with 8 days in January, 1889; while it fell to or below  $32^{\circ}$  in the screen on only 1 night, compared with 3 nights in January, 1889. The minima on the grass were  $32^{\circ}$ , or less, on 15 nights, compared with 16 nights in January, 1889.

At the beginning of the month changeable, but for the most part mild, weather held in Ireland and Scotland, while severe cold was experienced in central and eastern England, where also fogs of great density prevailed. These conditions were determined by the persistence of an anticyclone over Germany, France, and England, whereas pressure was relatively low over the Atlantic to the westward and northward of the British Islands. In Dublin the weather was generally fine—calm and fog alternating with clouds and squalls from S.W. Temperature was very unsteady in Dublin, which was on the borderland between the low anticyclonic temperatures of England and the high temperatures of the Atlantic seaboard.

The week ending Saturday, the 11th, was one of stormy, open weather, with frequent falls of rain, which, however, were not heavy on the east coast of Ireland. In Dublin the mean temperature was  $8^{\circ}$  above the average. All through, an oval anticyclone held over France and Germany—the barometer rising to 30.73 inches at Munich at 8 a.m. of Tuesday, the 7th—while a series of extensive and deep depressions skirted the western and northern coasts of Ireland and Scotland on their passage northeastwards. The week opened with a violent S.W. gale, which was accompanied with severe and fatal thunderstorms in the southwest and west of Ireland. At 8 a.m. of Sunday pressure varied from 28.73 inches at Stornoway, in the Hebrides, to 30.85 inches at Munich. On Tuesday temperature rose to  $56^{\circ}$  or  $57^{\circ}$  at many stations in the United Kingdom. In Dublin the mean height of the barometer during the week was 29.870 inches. The mean temperature was  $48^{\circ}4$ . Rain was measured on six days, the total quantity being .262 inch.

Stormy, unsettled weather, and high but variable temperatures prevailed throughout the week ending Saturday, the 18th. The barometer was continuously high over the Peninsula and Central Europe, very low over the Atlantic and Norwegian Sea, and most unsteady in the British Islands.

and Scandinavia. The result was that strong southwesterly gales raged from time to time on the British coast. The storms culminated in a tempest Friday night and Saturday morning. On Saturday afternoon also a violent S.W. gale prevailed, accompanied by driving showers of rain and hail, and by flashes of sheet lightning after dark. On Thursday the air was soft and balmy, as in late spring—the maximal temperature being  $51.6^{\circ}$  and the minimal temperature being  $50.1^{\circ}$ . In Dublin the mean height of the barometer was 29.787 inches. The mean temperature was as high as  $43.6^{\circ}$ . The rainfall was distributed over four days and amounted to .439 inch. Hail fell on Saturday, on the evening of which day also lightning was seen.

The period ending Saturday, the 25th, was most unsettled, stormy, rough and wet. Temperature was much lower than in the two preceding weeks, but it was very unsteady. A number of extensive and deep atmospheric depressions passed across north-western Europe during the week, causing violent gales, thunderstorms, and heavy falls of rain and sleet. Of these disturbances, the deepest was that of Sunday, January 18, at 8 a.m., of which day pressure varied from 30.37 inches at Lisbon to 28.23 inches at Stornoway, in the Hebrides. At 0.49 a.m. a violent hailstorm occurred in Dublin, and during the day thunder and lightning prevailed in Ireland, Scotland, and the west of England. Another deep depression came in over Scotland on Tuesday, causing a renewal of bad weather. This system was quickly followed by a cyclone of great intensity, the centre of which passed eastwards south of Dublin, where the wind backed through E. and N.E. to N. and N.W., with a heavy fall of cold rain and sleet. A S.W. to W. gale of exceptional violence blew in the English Channel. A curious effect of the arrival of this depression was to cause a temporary calm in Scotland, accompanied by sharp frost, the thermometer falling to  $21^{\circ}$  at Aberdeen on Thursday morning and not rising above  $25^{\circ}$  at that station during the day. A final area of low barometer reached Ireland on Friday night. It brought high temperatures and a strong S.W. gale. In Dublin the mean height of the barometer during the week was only 29.207 inches. The mean temperature was  $41.8^{\circ}$ . The rainfall amounted to .983 inch on six days—.304 inch being registered on Wednesday the 22nd.

Although still changeable in many respects, the weather moderated considerably after Sunday, the 26th, on which day a fresh S.W. gale was felt. Both on the 26th and 27th the barometer over the south of France stood about two inches higher than it did off the W. coast of Norway, and consequently westerly winds of great strength prevailed. In Dublin Sunday's gale was accompanied by a very heavy rainfall—more than eight-tenths of an inch being registered in 12 hours. In Dublin the mean height of the barometer in the week ending Saturday, February 1, was 30.123 inches. The mean temperature was  $43.2^{\circ}$ . Rain fell on four days—the total measurement being 1.204 inches, of which .643 inch fell on Sunday, the 25th.

**FEBRUARY.**—This month was remarkable for the contrast it afforded to January. South-easterly and easterly winds, quiet, chiefly fine weather, frequent fogs, and low temperature took the place of the blustering south-westerly gales, heavy and frequent rains, and high, unsteady temperatures of the preceding month. The mean atmospheric pressure was nearly half an inch ( $.464$  inch) above that of January, while the mean temperature was  $3^{\circ}$  below that of January.

In most particulars, February, 1890, may be regarded as a favourable month, but the amount of cloud—72.5 per cent.—was much in excess of the average, 66.0 per cent., and gave rather a gloomy aspect to the season, which was also notable for its foggy character.

In Dublin the mean temperature ( $41.5^{\circ}$ ) was  $1.2^{\circ}$  below the average ( $42.7^{\circ}$ ); the mean dry bulb readings at 9 a.m. and 9 p.m. were  $40.8^{\circ}$ . In the twenty-five years ending with 1889, February was coldest in 1873 (M. T. =  $37.9^{\circ}$ ) and warmest in 1890 (M. T. =  $46.7^{\circ}$ ). In 1886 the M. T. was  $39.7^{\circ}$ . In the year 1879 (the cold year) it was  $40.1^{\circ}$ . In 1888 it was as low as  $38.6^{\circ}$ , and in 1889 it was  $40.3^{\circ}$ .

The mean height of the barometer was 30.204 inches, or  $0.342$  inch above the average value for February—namely, 29.862 inches. The mercury rose to 30.744 inches at 11 a.m. of the 29th, and fell to 29.539 inches at 9 a.m. of the 16th. The observed range of atmospheric pressure was, therefore, 1.205 inches—that is, a little over one inch and two-tenths. The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was  $40.8^{\circ}$ , or  $3.3^{\circ}$  below the value for January, 1890. Using the formula  $\text{Mean Temp.} = \text{min.} + (\text{max.} - \text{min.}) \times .50$ , the value becomes  $41.3^{\circ}$ , compared with a twenty-five years' average of  $42.7^{\circ}$ . On the 1st the thermometer in the screen rose to  $52.5^{\circ}$ —wind W.S.W.; on the 16th the temperature fell to  $27.9^{\circ}$ —wind calm. The minimum on the grass was  $30^{\circ}$  on the 8th and 14th.

The rainfall was only .803 inch, distributed over 7 days. The average rainfall for February in the twenty-five years, 1865-89, inclusive, was 2.150 inches, and the average number of rainy days was 17.2. The rainfall and the rainy days, therefore, were both considerably below the average. In 1882 the rainfall in February was large—3.752 inches on 17 days; in 1879, also, 3.706 inches fell on 23 days. On the other hand, in 1873, only .928 of an inch was measured on but 8 days; and in 1887 only .541 inch of rain fell on 11 days. The rainfall in 1890 was much the smallest recorded in February for very many years.

Snow or sleet fell on the 18th and 28th. Hail fell on the 27th. The atmosphere was foggy on as many as 10 days, namely—the 5th, 6th, 8th, 14th, 15th, 16th, 21st, 22nd, 23rd, and 24th. High winds were noted on 6 days, reaching the force of a gale on only one day—the 12th. The temperature exceeded  $50^{\circ}$  in the screen on but 2 days, compared with as many as 17 days in January, and with 8 days in February, 1880; while it fell to or below  $30^{\circ}$  in the screen on 5 days, compared with only 1 day in January, but with 4 in February, 1880. The minimum on the grass were  $32^{\circ}$ , or less, on 18 nights, compared with 15 nights in January and 21 nights in February, 1889. On 2 days the thermometer did not rise above  $40^{\circ}$  in the screen.

Fine, quiet, cool weather held almost throughout the first week (1st-8th). The barometer was generally high in central Europe, England and Ireland; low in the extreme north; and relatively

low over the Mediterranean and neighbouring countries. Strong S.W. to N.W. winds prevailed to the northward, moderate easterly breezes to the southward, while in the central zone between the northern and southern areas of low pressure, calms and very variable airs were observed, with fogs and frosts at times. Except on the west coast of Norway, the precipitation was small during the week. In Dublin the mean height of the barometer was 30.340 inches. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 40.0°. The corrected mean temperature, deduced from the daily extremes in the shade, was 41.0°. Rain fell in appreciable amount on only one day, the quantity measured being but 0.10 inch (on Tuesday). At Christiansund, in Norway, on the contrary, the rainfall for the week up to 8 a.m. of Saturday amounted to 2.33 inches and was distributed over six days. Sharp frosts occurred over central Ireland on Wednesday and Saturday, the 5th and 8th, the lowest readings in the screen at Parsonstown being 23° and 25° respectively, on the mornings of those days.

During the week ended Saturday, the 15th, the weather was throughout cold. Until the 14th it was very dry, with fresh, or strong searching south-easterly winds and much cloud. On that day a considerable fall of cold rain occurred, and Saturday proved bitterly cold, with a westerly wind and a vapour fog. During the greater part of the week an anticyclone, in the centre of which the barometer at one time stood above 30.5 inches, lay over the North Sea, Scandinavia, and the Baltic. It was to this system that the searching S.E. winds of the period owed their origin. On Tuesday the barometer fell decidedly, as a depression approached the S.W. of England from the Atlantic. This disturbance caused very heavy rain in Cork—55 inch being measured on Wednesday, and 1.16 inches on Thursday, at Roche's Point, near Queenstown. On Saturday the barometer again fell, while the wind became westerly or north-westerly with fog and a low temperature. In parts of England a good deal of snow fell. In Dublin the mean height of the barometer was 29.985 inches. The corrected mean temperature was 38.9°; the mean dry bulb readings at 9 a.m. and 9 p.m. were 38.4°. Rain fell to the amount of 0.09 inch on Friday.

Very damp, changeable, dull weather prevailed during the greater part of the third week, which began in Dublin with a dense vapour fog and a very low temperature—27.9° in the screen. Until Saturday, the 22nd, a vast anticyclone lay over the north-east of Europe, while the barometer was low over the Atlantic to the south-westward of the British Islands. Consequently, easterly to southerly winds prevailed, accompanied by frost on the Continent; low temperature, cloudy skies, and gloom or fog in Great Britain; and a mild damp atmosphere, with frequent rain, in Ireland. On Saturday, however, the barometer rose fast in this country, as a new area of high pressure formed over Western Europe, and the week closed with a promise of quiet, cold weather. In Dublin the mean height of the barometer was 30.022 inches. The mean temperature was 43.2°; the mean dry bulb temperature at 9 a.m. and 9 p.m. was 42.6°. Rain was measured on three days, the total down-fall being .520 inch, of which .278 inch was caught on Sunday and 1.62 inch on Monday. The week began and ended with a dense vapour fog.

In the closing period of the month, from the 23rd to the 28th inclusive, at first mild and cloudy, the weather afterwards became cold and dry, with very keen polar winds, and snow showers in Great Britain and Ireland. The barometer was high throughout in Ireland, while depressions passed in a south-easterly or southerly direction across Scandinavia, the Baltic, and Russia. Hence polar winds prevailed in Western Europe. On Sunday, the 23rd, an anticyclone stretched across England and Ireland, in which countries the barometer stood at 30.70 inches or upward—at 8 a.m. the reading at Ballymullet was 30.75 inches, at 11 a.m. that in Dublin was 30.744 inches. Gradients for northerly winds became more and more pronounced until Friday, the 28th, when a great current of polar air was flowing southwards all across Europe, and frost and snow were reported from most British and Continental stations, with a very dry searching air, particularly in Ireland. A solar and a lunar halo were seen on Friday, February 28.

The rainfall in Dublin during the two months ending February 28th has amounted to 3.777 inches on 28 days, compared with 4.032 inches on 36 days in 1889 and 2.344 inches on 23 days during the same period in 1888, and with a 25 years' average of 4.360 inches on 25 days.

At Greystones, Co. Wicklow, the rainfall in February, 1890, was 1.083 inches, distributed over 7 days. Of this quantity .390 inch fell on the 16th. Since January 1st, 5.555 inches of rain have fallen at that station on 29 days.

**MARCH.**—March, 1890, was a month of contrasts. As in 1889, it opened with very severe weather, a violent snowstorm being felt in the S.E. of England on the 1st and 2nd, the thermometer falling to 0° Fahr. at Hillington, in Norfolk. Warm and cold spells then succeeded each other to the close of the month, and heavy falls of rain occurred at times. On the whole there was a mean temperature above the average, and the rainfall also was in Dublin largely in excess. The mean height of the barometer was .415 inch below that of February, but .040 above that of January, 1889.

In Dublin the mean temperature (44.1°) was considerably above the average (43.1°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 44.6°. In the twenty-five years ending with 1889, March was coldest in 1877 and 1883 (M. T. = 39.0°), and warmest in 1888 (M. T. = 47.3°). In 1876 the M. T. was 41.1°, in 1879 (the cold year) it was 42.5°, in 1888 it was as low as 39.8°, and in 1889 it was 44.0°. As a general rule, February in Dublin is only a shade colder than March. This is due to the fact that the Continental anticyclone usually embraces the British Isles and Scandinavia in March, causing easterly winds. In the present year, however, February was 3.0° colder than March.

The mean height of the barometer was 29.789 inches, or 0.134 inch below the average value for March—namely, 29.923 inches. The mercury rose to 30.584 inches at 9 a.m. of the 3rd, and fell to 29.904 inches at 4 p.m. of the 24th. The observed range of atmospheric pressure was, therefore, 1.680 inches—that is, nearly an inch and seven-tenths. The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 44.6°, or 2.8° above the value for February, 1889. Using the formula, Mean Temp.=min. + (max.—min. × 485), the value becomes

44°. The arithmetical mean of the maximal and minimal readings was 45·1°, compared with a twenty-five years' average of 43·1°. On the 12th the thermometer in the screen rose to 59·6°—wind W.S.W.; on the 3rd and 9th the temperature fell to 31·2°—wind, N.E. and W.N.W. respectively. The minimum on the grass was 24·0 on the 3rd. The rainfall was as much as 3·603 inches, distributed over 17 days. The average rainfall for March in the twenty-five years, 1865-90, inclusive, was 2061 inches, and the average number of rainy days was 10·5. The rainfall, therefore, was much above the average, while the rainy days were slightly above it. In 1887 the rainfall in March was very large—4·972 inches on 22 days; in 1888, 3·738 inches fell on 18 days; in 1866 also 3·639 inches fell on 21 days. On the other hand, in 1871, only .845 of an inch was measured on 12 days; and in 1874 only .533 of an inch fell, also on 12 days. In 1887 (the "dry year") 1·483 inches of rain fell on 15 days, and in 1889 1·070 inches fell on, however, as many as 17 days.

The atmosphere was foggy on the 10th, 20th and 27th. High winds were noted on 15 days, reaching the force of a gale on 4 days—the 7th, 8th, 10th, and 24th. Snow or sleet occurred on the 1st, 2nd, 9th, 16th, 18th, and 23rd; and hail fell on the 1st, 2nd, and 8th. The temperature exceeded 50° in the screen on 19 days, compared with only 2 days in February, and 17 days in January; while it fell to or below 32° in the screen on 4 days, compared with 6 in February and only 1 day in January. The minima on the grass were 32°, or less, on 16 nights, compared with 18 nights in February and 15 nights in January. On 2 days the thermometer did not rise to 40° in the screen.

The period ending on Saturday, the 8th, was divided into a very cold and a mild although stormy period—the former lasting until Tuesday the 4th in Ireland, but until Wednesday in England. A small but well-marked depression—which on Saturday, the 1st, had quickly travelled down the east coast of Great Britain as far as Spurn Head, and thence in a southwesterly direction across England—was found over Brittany on the 2nd. It caused heavy falls of snow in the S.E. of England, and showers of hail and snow in most parts of the country. In the wake of this depression an extraordinary fall of temperature took place in the centre and S.E. of England. Early on Tuesday morning the thermometer fell to 18° at Loughborough, 17° at Oxford, 15° in London, 14° at Cambridge, 13° at Dungeness, and 6° at Wellington, Nottinghamshire—these were the lowest temperatures experienced in England during the present winter. Milder weather had already set in at the northern stations and spread quickly southwards. A series of deep depressions now travelled eastward across Northern Europe, causing gales, frequent showers, and very unstable temperatures. At 8 a.m. of Friday the barometer varied from 30·15 inches at Boulogne in France to 28·60 inches at Christiania in Norway. At 11 a.m. of Saturday a violent squall of hail, rain, thunder and lightning passed over Dublin. The mean height of the barometer during the first week (2nd-8th inclusive) was 30·012 inches. The mean temperature was 42·5°, the mesudry bulb readings at 9 a.m. and 9 p.m. being 42·2°. Rain was measured on four days, the total amount being 250 inch, of which 120 inch fell on Saturday.

During the greater part of the second week (9th-14th, inclusive), strong, westerly and south-westerly winds prevailed, but the weather remained for the most part dry. The general distribution of atmospheric pressure was—low in the north, high in the south. Hence the westerly winds of the period. On Sunday, the 9th, a frost occurred in the rear of a depression, which had passed eastwards across the lowlands of Scotland the previous evening. The wind afterwards backed gradually from N.W. to S.W. and finally to S., from which last point it blew freshly on Friday night. On Tuesday and Wednesday the thermometer rose to 60° or upwards in the shade at several stations in Great Britain—the highest reading of all being 63° at Aberdeen on Wednesday. In Dublin the mean height of the barometer was 29·642 inches. The mean temperature was 47·9°. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 48·1°. The thermometers in the screen fell to 31·2° on Sunday but rose to 50° on Wednesday. Rain was measured on three days—the total quantity being 857 inch. Of this amount 190 inch was credited to Sunday, and 634 inch to Saturday.

At the beginning and close of the third week, changeable, rainy weather prevailed in Dublin—during the intervening period it was chiefly fine and quiet. Between Tuesday, the 18th, and Friday, the 21st, a deep depression travelled northwestwards from the south of Germany to the west of Scotland. It caused very unsettled weather, with heavy falls of rain and sleet, in the S.E., E., and N.E. of Great Britain, while it was very fine in Ireland. The week began with a deep and complex depression lying over this country—the barometer being as low as 29 inches at 8 a.m. of Sunday in Ulster and Leinster. Throughout the week numerous areas of low pressure lay over Western Europe, travelling in anomalous and erratic directions. Hence the changeable weather of the period. In Dublin the mean height of the barometer was 29·493 inches. The mean temperature was 41·7°. The mean of the dry bulb readings at 9 a.m. and 9 p.m. was 41·5°. The rainfall was 553 inch, distributed over four days. Of this amount, 138 inch was measured on Monday and 244 inch on Saturday. Sleet fell on Sunday and Tuesday. There were fogs on Wednesday and Thursday.

The chief characteristic of the weather during the week ended Saturday, the 29th, so far as Dublin is concerned, was a frequent and heavy downpour of rain—the precipitation amounting to 2·003 inches on five days. At the same time a decided increase of temperature was noted generally, so that on Friday the 28th the thermometer rose to 66° in London, 73° in Paris, and 79° at Biarritz. During the week several depressions crossed the British Islands in an easterly direction. Of these, the deepest was observed on Monday, when the barometer sank to 28·004 inches in Dublin, and a fresh S.E. gale and incessant rain prevailed. Two moderately fine days succeeded, but the weather became broken and rainy once more on Thursday, gloom and continuous rain occurring on Friday. Bright, dry weather and a fresh westerly breeze followed on Saturday. In Dublin the mean height of the barometer was 29·635 inches, pressure ranging between 28·904 inches at 4 p.m. of Monday (wind, E.S.E.) and 30·052 inches at 9 p.m. of Saturday (wind, W.). The mean temperature was 48·3°; the mean dry bulb temperature at 9 a.m. and 9 p.m. being 47·2°. The rainfall amounted to 2·003 inches on five days. Of this large quantity, 976 inch was registered on Monday and 400 inch on Friday.

The last two days were fine, quiet, cool, and dry—the month going out "like a lamb," as it had come in "like a lion."

The rainfall in Dublin during the three months ending March 31st has amounted to 7·470 inches on 45 days, compared with 5·738 inches on 53 days during the same period in 1889, 6·067 inches on 41 days in 1888, and a 25 years' average of 6·111 inches on 51·0 days.

APRIL.—April, 1890, was generally a favourable month. The mean temperature, rainfall, and rainy days were all somewhat below the average. Considered by weeks, the weather was first fine, dry, and quiet; then cold and showery; then dull and cheerless; then unsettled, equally, and showery, and lastly fine.

In Dublin the mean temperature ( $47\frac{3}{4}^{\circ}$ ) was slightly below the average ( $47\frac{7}{8}^{\circ}$ ); the mean dry bulb readings at 9 a.m. and 9 p.m. were  $46\cdot3^{\circ}$ . In the twenty-five years ending with 1889, April was coldest in 1879 (the cold year) (M.T.= $44\frac{3}{4}^{\circ}$ ), and warmest in 1865 and 1874 (M.T.= $50\frac{4}{5}^{\circ}$ ). In 1888, the M.T. was  $46\cdot3^{\circ}$ ; in 1887 it was as low as  $45\cdot1^{\circ}$ ; in 1888 it was only  $45\cdot7^{\circ}$ , and in 1889 it was  $46\cdot1^{\circ}$ .

The mean height of the barometer was 29·812 inches, or 0·015 inch below the average value for April—namely, 29·827 inches. The mercury rose to 30·302 inches at 9 a.m. of the 1st, and fell to 29·457 inches at 9 p.m. of the 13th. The observed range of atmospheric pressure was, therefore, only 0·845 inch—that is, a little more than eight-tenths of an inch. The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was  $46\cdot3^{\circ}$ , or only  $1\cdot7^{\circ}$  above the value for March, 1890. Using the formula, Mean Temp.—min. + (max.—min.  $\times \frac{1}{75}$ ), the value becomes  $47\cdot0^{\circ}$ , or  $4\cdot4^{\circ}$  below the average mean temperature for April, calculated in the same way, in the twenty-five years, 1865–89, inclusive ( $47\cdot4^{\circ}$ ). The arithmetical mean of the maximal and minimal readings was  $47\cdot3^{\circ}$ , compared with a twenty-five years' (1865–1889 inclusive) average of  $47\cdot7^{\circ}$ . On the 20th, the thermometer in the screen rose to  $63\cdot6^{\circ}$ —wind S.W.; on the 3rd the temperature fell to  $31\cdot2^{\circ}$ —wind, calm. The minimum on the grass was  $24\cdot8^{\circ}$  on the same date. The rainfall was 1·375 inches, distributed over 14 days. The average rainfall for April in the twenty-five years, 1865–89, inclusive, was 2·055 inches, and the average number of rainy days was 19·2. The rainfall, therefore, was considerably below the average, while the rainy days were also deficient. In 1877 the rainfall in April was very large—4·707 inches on 21 days; in 1882 also 3·226 inches fell on 20 days. On the other hand, in 1873, only 4·98 of an inch was measured on 8 days; and in 1870 only 3·35 of an inch fell, also on 8 days.

No solar halos were seen. There was a lunar halo on the 24th. The atmosphere was more or less foggy on the 1st, 2nd, 3rd, 4th, 11th, 12th, 27th, and 28th. High winds were noted on 11 days, but on only two occasions was the force of a gale attained—namely, on the 7th and 22nd. Snow or sleet occurred on the 10th; and hail fell on the 8th, 10th, 22nd, 23rd, and 25th. The temperature exceeded  $50^{\circ}$  in the screen on 23 days, compared with 19 days in March, 2 days in February, and 17 days in January. It fell below  $22^{\circ}$  in the screen on one night only—that of the 3rd. The minima on the grass were  $32^{\circ}$ , or less, on 18 nights, compared with 16 nights in March, 18 in February, and 13 nights in January. The mean lowest temperature on the grass was  $34\cdot1^{\circ}$ , compared with  $34\cdot4^{\circ}$  in 1889,  $34\cdot6^{\circ}$  in 1888, and  $31\cdot3^{\circ}$  in 1887. A peal of thunder was heard to the westward at 12·10 p.m. on the 26th.

During the period ending Saturday the 5th anticyclonic conditions, accompanied with fine, dry, quiet, cool weather prevailed. The barometer was uniformly rather high and the winds were light and variable. The diurnal range of temperature was large. On the 3rd not a cloud was seen from morning to night. On Saturday the 5th it became evident that areas of low atmospheric pressure were about to encroach on the Irish coast from the Atlantic—the barometer fell decidedly, clouds increased, and temperature rose. In Dublin the barometer ranged from 30·302 inches at 9 a.m. of Tuesday the 1st (wind, N.), to 29·942 inches at 9 p.m. of Saturday the 5th (wind, S.W.). The thermometer rose to  $56\cdot3^{\circ}$  on Friday, having fallen the previous day to  $31\cdot2^{\circ}$  in the screen and to  $24\cdot8^{\circ}$  on the grass. Rain fell only on Saturday night, the resulting measurement being 0·19 inch.

Severe weather prevailed during the greater part of the second week—polar winds, cold showers, and frosty nights being experienced after Easter Day, the 6th, which was chiefly fine and mild. On this day a general decrease of atmospheric pressure occurred all over North-Western Europe, and at night an extensive depression travelled eastwards across Scotland, momentarily growing deeper. It passed equally S.W. and afterwards N.W. and N. winds, and rain fell generally. By 8 a.m. of Tuesday, the 8th, the centre of this system had reached the Skager-Rack, the barometer being as low as 28·84 inches at the Seaw—northerly winds, showers of hail, sleet, and cold rain, and low temperatures were prevalent in the British Islands, especially in Great Britain, where also thunder and lightning occurred at many stations. At this station the mean height of the barometer was 29·851 inches. The mean dry bulb temperature at 9 a.m. and 9 p.m. was  $44\cdot8^{\circ}$ , while the mean calculated from the daily highest and lowest readings in the shade was  $45\cdot2^{\circ}$ . The rainfall was 2·90 inch, on four days; the heaviest fall in 24 hours being 1·06 inch on Thursday.

On the east coast of Ireland, as is usual in easterly winds, very dull, cold, cheerless, weather prevailed throughout the third week, and the 13th and 14th were wet in Dublin. In the west and northwest, however, the weather was much finer and brighter, although cold for the time of year. A severe thunderstorm occurred in the counties of Cork and Kerry on Thursday the 17th. During the entire period the weather was determined by a large area of low atmospheric pressure, which advanced slowly northwards and at the same time spread out in an easterly direction across France and Germany, while all through the barometer was high over Lopland and the northern part of Sweden and Norway. Fresh or equally easterly winds, consequently, prevailed, accompanied by low temperature, densely clouded skies, and cold rain at times. Thunder storms were reported daily from France after Sunday. Early on the morning of that day severe frost occurred in Great Britain—the lowest temperature of all being  $24^{\circ}$  at Nairn. In Dublin the mean height of the

barometer was 29.636 inches. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 43.8°; the corrected mean of the daily highest and lowest shade temperature was 46.2°. The rainfall was .503 inch on two days—.433 inch fell on Tuesday and .064 inch on Wednesday. The mean amount of cloud at 9 a.m. and 9 p.m. was no less than 82 per cent.

At first summerlike, the weather in the week ending Saturday, the 26th, soon became unsettled, equally, showery, and cold; but towards the close of the period a marked improvement was seen. On Sunday gradients for southwesterly winds forced over Ireland, where temperature rose quickly—to 63.0° in Dublin and 62° at Parsonstown. But this change from winter to summer was of no long continuance, for by Monday morning the first of a series of depressions had reached the north coast, bringing with it squalls, showers, and a fall of temperature. A succession of typical showery April days followed—the worst weather of all being experienced in the South of England on Thursday and Friday owing to the formation in that district of a deep secondary barometrical depression. With a veering of the wind to N. on Saturday, the weather improved, becoming bright and bracing. In Dublin the mean height of the barometer was 29.735 inches. The mean temperature was 49.5°; the mean dry bulb temperature at 9 a.m. and 9 p.m. was 48.4°. Rain fell on five days to the amount of .383 inch, .120 inch being measured on Friday and .118 inch on Wednesday. Hail fell in Dublin on three days, and thunder was heard about midday on Saturday.

The weather of the last four days of the month was favourable, a copious but genial rainfall occurring on the 29th.

The rainfall in Dublin during the four months ending April 30th has amounted to 9.043 inches on 59 days, compared with 8.345 inches on 74 days during the same period in 1889, 8.060 inches on 58 days in 1888, and a 25 years' average of 9.468 inches on 66.2 days.

At Knockdolian, Greystones, Co. Wicklow, the rainfall during April, 1890, amounted to 1.483 inches, distributed over 20 days.

MAY.—Although changeable and generally showery, May, 1890, may be regarded as a favourable month both from a public health point of view and from that of agriculture. Until the 20th rain fell in frequent showers, and conditions were decidedly unsettled. After the date named, however, a succession of bright, spring-like days occurred, giving a wonderful impetus to vegetation.

In Dublin the mean temperature (53.2°) was decidedly above the average (52.0°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 52.8°. In the twenty-five years ending with 1889, May was coldest in 1879 (M. T. = 45.2°), in 1885 (M. T. = 48.7°), and in 1879 (the "cold year") (M. T. = 43.8°). It was warmest in 1862 (the "warm year") (M. T. = 55.6°) and 1875 (M. T. = 54.9°). In 1886, the M. T. was 50.5°; in 1887 it was 51.2°, in 1888 it was 52.5°, and in 1889 it was 54.9°.

The mean height of the barometer was 29.807 inches, or 0.182 inch below the corrected average value for May—namely, 29.989 inches. The mercury rose to 30.253 inches at 9 p.m. of the 22nd, and fell to 29.877 inches at 9 a.m. of the 16th. The observed range of atmospherical pressure was, therefore, .976 of an inch—that is, a little less than nine-tenths of an inch. The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 52.5°, or 0.5° above the value for April, 1890. Using the formula, Mean Temp. = min. + (max. — min. × .97), the value was 53.8°, or 1.2° above the average mean temperature for May, calculated in the same way, in the twenty-five years, 1865-89, inclusive (51.6°). The arithmetical mean of the maximal and minimal readings was 53.2°, compared with a twenty-five years' average of 52.0°. On the 23rd, the thermometer in the screen rose to 65.7°—wind E.; on the 31st the temperature fell to 39.1°—wind, N.N.W. The minimum on the grass was 33.0°, on the 3rd. The rainfall amounted to 2.438 inches, distributed over 17 days. The average rainfall for May in the twenty-five years, 1865-89, inclusive, was 2.636 inches, and the average number of rainy days was 15.4. The rainfall and the rainy days, therefore, were somewhat above the average. In 1886 the rainfall in May was very large—5.472 inches on 21 days; in 1869 also 5.414 inches fell on 19 days. On the other hand, in 1871, only .973 of an inch was measured on 9 days; in 1876 only .798 of an inch fell on 6 days; in 1887 only .852 of an inch fell on 10 days; and in 1888 only .978 of an inch on 11 days. In 1889, 2.131 inches fell on 17 days.

There were no solar halos, but a lunar halo was seen at 11 p.m. of the 31st. The atmosphere was foggy on the 16th. High winds were noted on as many as 19 days, attaining the force of a gale, however, on not one occasion. Hail occurred on the 14th. The only heavy falls of rain were on the 3rd (.556 inch), on the 16th (.290 inch), and on the 19th (.270 inch). There were no electrical disturbances in Dublin, but lightning was seen on the night of the 24th.

During the month the thermometer in the screen did not fall below 39.1° (on the 31st), and on not a single night was a temperature of 32° or less recorded on the grass. The mean minimal temperature on the grass was 42.2°, compared with 42.4° in May, 1889, 37.5° in 1888, and 37.9° in 1887.

May Day (Thursday), was beautifully fair and bright. A succession of depressions then began to approach Ireland from the westward, causing unsettled weather and falls of rain. On Saturday, the third, an excessively wet day, .456 of an inch fell.

During the week ended Saturday, the 10th, changeable, somewhat showery weather, and easterly (S.E. blowing to N.E.) winds, prevailed. Speaking generally, the barometer stood high over the North of Scandinavia and of Russia, whereas it was low across Central Europe. In the last named district several areas of low pressure were observed from time to time, keeping the weather in an unsettled, showery, thundery state. Tuesday, the 6th, proved fair and bright, but in the afternoon electrical clouds overspread the sky, and a thunderstorm occurred at Holyhead. In Dublin the mean height of the barometer was 29.592 inches, pressure, receding to 29.377 inches at 9 a.m. of Saturday (wind, E.N.E.). The mean temperature was 51.6°. The mean of the dry bulb readings at 9 a.m. and 9 p.m. was 51.4°. Rain fell on the six days to the total amount of .531 inch.

Very changeable, showery weather prevailed in Ireland throughout the week ended Saturday, the 17th, where the wind generally blew from southwesterly points. In England the beginning and close

of the period were unsettled, but from Tuesday to Friday inclusive it was fine, sunny, and warm. On Monday and again on Friday, the thermometer rose to 68° or 70° at the central and southeastern English stations. During the week four distinct areas of low pressure passed across Western Europe from S. to N. Of these the first travelled along the east coast of Great Britain on Sunday, disappearing to the northward of Scotland on Monday, when the second system had already arrived on the Riviera from the Mediterranean. This disturbance reached the Christians Fjord in Norway by Thursday morning. Lastly two depressions passed northwards across Ireland in rapid succession on Friday and Saturday, causing heavy rains and squalls. In Dublin the mean height of the barometer was 29.644 inches. The mean temperature was 51.6°. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 51.0°. Rain fell to the amount of .364 inch, on six days. Hail fell on Wednesday, the 14th. Gloom and fog prevailed on Friday.

In the week ended Saturday, the 24th, at first changeable and showery, the weather finally became brilliant and summerlike, with clear skies and a cool easterly breeze. On Sunday morning rain fell in heavy showers and the wind blew freshly from S.E. As the day wore on, the weather improved and a depression off the S.W. of Ireland moved away over the Atlantic. On Tuesday morning another depression had advanced to St. George's Channel in an irregular direction from Spain and the Bay of Biscay. It caused heavy rains and great gloom in Ireland and the south of England. As it passed off, an area of high pressure formed over Western Europe, producing a grateful change to bright sunshine and genial warmth—and these lasted to the close of the week. In Dublin, the mean height of the barometer was 29.900 inches, pressure increasing from 29.617 inches at 9 a.m. of Tuesday (wind, S.E.), to 29.255 inches at 9 p.m. of Thursday (wind also S.E.). The mean temperature was 56.1°—the mean dry bulb temperature at 9 a.m. and 9 p.m. being 55.8°. The thermometers in the screen rose to 65.7° on Friday—the maximum of the month. Rain was measured on two days—the total quantity being .281 inch, of which .270 inch fell in the 24 hours ending 9 a.m. of Tuesday. Faint sheet lightning was seen on the south-eastern horizon on Saturday night.

Very fine, bright weather held during the greater part of the last week (25th–31st, inclusive), Thursday, the 29th, being an exception owing to the approach of an extensive depression from the northwestward to Scotland, the south of Norway, and the North Sea. At the beginning, an anticyclone was found off the North of Scotland, while areas of low pressure were moving westwards along the southern shores of the British Islands, and a deep depression was forming over the Baltic. Thunder storms prevailed in the Channel Islands, the S.W. of England, and the S. of Ireland. A succession of beautiful days followed until Thursday, when a depression, with several subdepressions, approached North-western Europe from N.W. It caused clouds and rain generally and a remarkable fall of temperature, so that on Friday night ground-frost was felt at several British and Irish stations, snow and hail having already fallen in Scotland and the Hebrides. Saturday was again fine and chiefly bright. In Dublin the mean height of the barometer was 30.066 inches. The mean temperature was 52.9°. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 53.4°. The thermometers in the screen rose to 64.6° on Sunday, and fell to 39.1° on Saturday. The rainfall amounted to .242 inch, all of which fell on Thursday.

The rainfall in Dublin during the five months ending May 31st has amounted to 11.488 inches on 76 days, compared with 10.476 inches on 91 days during the same period in 1889, 9.068 inches on 69 days in 1888, 6.483 inches on 62 days in 1887, and a 25 years' average of 10.405 inches on 51.6 days.

At Knockdolian, Greystones, Co. Wicklow, the rainfall in May, 1890, was 3.680 inches, distributed over 29 days. Of this quantity .730 inch fell on the 4th, .550 inch on the 17th, and .460 inch on the 20th.

**JUNE.**—A cloudy, showery, windy month of average temperature and atmospheric pressure, and showing a marked preponderance of south-westerly and westerly winds.

In Dublin the mean temperature (55.1°) was slightly above the average (57.8°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 57.6°. In the twenty-five years ending with 1889, June was coldest in 1882 (M. T.=55.6°), and in 1879 (the "cold year") (M. T.=55.9°). It was warmest in 1887 (M. T.=57.2°), in 1885 (M. T.=57.0°), and in 1888 (the "warm year") (M. T.=56.5°). In 1886, the M. T. was 57.5°; in 1888 it was 56.2°, and in 1889 it was 55.3°.

The mean height of the barometer was 29.944 inches, or 0.027 inch above the corrected average value for June—namely, 29.917 inches. The mercury rose to 30.075 inches at 9 a.m. of the 14th, and fell to 29.126 inches at 3 p.m. of the 30th. The observed range of atmospheric pressure was, therefore, 1.240 inches—that is, almost an inch and a quarter. The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 57.4°, or 4.7° above the value for May, 1890. Using the formula,  $\text{Mean Temp.} = \text{min.} + (\text{max.} - \text{min.}) \times 4/55$ , the value was 57.6°, or 0.4° above the average mean temperature for June, calculated in the same way, in the twenty-five years, 1865–89, inclusive (57.2°). The arithmetical mean of the maximal and minimal readings was 58.1°, compared with a twenty-five years' average of 57.6°. On the 5th, the thermometer in the screen rose to 72.0°—wind, S.W.; on the 7th the temperature fell to 43.2°—wind, N. The minimum on the grass was 38.5°, also on the 7th.

The rainfall amounted to 1.930 inches, distributed over 18 days. The average rainfall for June in the twenty-five years, 1865–69, inclusive, was 1.617 inches, and the average number of rainy days was 13.6. The rainfall and the rainy days, therefore, were above the average. In 1878 the rainfall in June was very large—5.058 inches on 19 days; in 1879 also 4.046 inches fell on 24 days. On the other hand, in 1882, only .100 of an inch was measured on 8 days; in 1887, the rainfall was only .232 of an inch, distributed over only 5 days; in 1874 only .405 of an inch was measured on 9 days, and in 1886 only .677 of an inch fell on but 6 days. In 1888 the rainfall was as much as 3.045 inches, distributed over as many as 18 days.

High winds were noted on 15 days, but attained the force of a gale on only two occasions—the 3rd and 25th. Temperature reached or exceeded  $70^{\circ}$  in the screen on only 2 days, as compared with 17 days in 1887, only 1 day in 1888, and 10 days in 1889. Thunder was heard on the 11th and 28th, and hail fell on the 28th and 30th.

In the first week the weather was chiefly favourable, although changeable, with squally westerly (W., S.W., and N.W.) winds, much cloud at times, and heavy rains in Scotland and the north, west, and south of Ireland, as well as in the south of England on Wednesday. The barometer was generally low in the extreme N. and N.W., high over the Bay of Biscay and central Europe. In Dublin the mean height of the barometer was 29.931 inches. The corrected mean temperature was  $56.7^{\circ}$ . The mean dry bulb temperature at 9 a.m. and 9 p.m. was  $56.0^{\circ}$ . Rain was measured on three days, the total quantity being .305 inch.

During the greater part of the second week the weather was in an unsettled showery state, and thunder and lightning often accompanied the showers in various parts of the United Kingdom. Areas of low pressure were found in the W. and N.W., but on Thursday, the 12th, an area of high pressure formed over the Atlantic and gradients for northerly winds became established. In Dublin the mean height of the barometer was 29.927 inches, pressure ranging between 29.430 inches at 6 p.m. of Wednesday (wind, calm) and 30.375 inches—the maximum for the month—at 9 a.m. of Saturday (wind, N.W.). The corrected mean temperature was  $57.6^{\circ}$ , the mean dry bulb temperature at 9 a.m. and 9 p.m. being  $56.7^{\circ}$ . Rain fell in measurable quantity on four days, the total fall being .327 inch.

Changeable, cloudy, and at times showery weather prevailed during the third week—particularly in Ireland and Scotland. Some bright intervals were experienced in England. The barometer was relatively high over the Bay of Biscay, France, and Germany; relatively low over Scotland and Scandinavia. Hence the fresh westerly winds, and showers, and clouds of the period. On Tuesday morning, the 17th, a partial eclipse of the sun was well seen through passing clouds—the magnitude of the eclipse was 279 out of 1,000 parts. In Dublin the mean height of the barometer was 29.084 inches. The corrected mean temperature was  $58.0^{\circ}$ ; the mean dry bulb temperature at 9 a.m. and 9 p.m. being  $57.3^{\circ}$ . Rain fell in measurable quantity on four days, the total amount being .291 inch.

The weather continued very changeable, squally, and showery during the period ending Saturday, the 28th. The general distribution of pressure was very like that observed in the previous week—that is, a relatively high barometer over the Bay of Biscay, France and Germany, with low pressures to the north-westward and northward of the British Isles and over northern Europe. Hence the prevalence of fresh westerly winds, clouds, and showers. The only serious depression observed was one which advanced rapidly towards the north of Scotland on Tuesday night, the 24th. It caused a disastrous gale in the Solway Firth, and in Scotland north of the Grampians—even in Dublin the wind rose to the force of a moderate gale for a short time. Very heavy showers fell on Friday and Saturday, accompanied by some thunder locally, and hail was also observed about noon on Saturday, when the wind veered to N. In Dublin the mean height of the barometer was 29.081 inches. The mean temperature was  $57.6^{\circ}$ ; the mean dry bulb temperature at 9 a.m. and 9 p.m. was  $57.6^{\circ}$ . Rain was registered on five days—the total measurement being .432 inch.

Sunday, the 29th, proved for the most part fine, but a brisk fall of the barometer took place as a depression, which was unusually deep for the time of year, advanced over the kingdom from W.N.W. On the 30th, heavy showers of rain and hail occurred, and the barometer sank to 29.126 inches at 3 p.m.

The rainfall in Dublin during the six months ending June 30th has amounted to 12,413 inches on 94 days, compared with 10,376 inches on 97 days during the same period in 1888, 12,113 inches on 87 days in 1888, 6,741 inches on 67 days in 1887, and a twenty-five years' average of 12,813 inches on 95-6 days.

At Knockholian, Greystones, County Wicklow, the rainfall in June, 1890, was 1,780 inches distributed over 18 days. Of this quantity .410 inch fell on the 11th, .300 inch on the 5th, and .150 inch on the 25th.

**JULY.**—A very unsettled, squally, showery, cool month, with a great preponderance of south-westerly to north-westerly winds—a very common state of things in an Irish July.

In Dublin the mean temperature ( $53.1^{\circ}$ ) was decidedly below the average ( $60.6^{\circ}$ ); the mean dry bulb readings at 9 a.m. and 9 p.m. were  $57.8^{\circ}$ . In the twenty-five years ending with 1889, July was coldest in 1879 (the "cold year") (M.T.— $57.2^{\circ}$ ). It was warmest in 1887 (M.T.— $61.7^{\circ}$ ), and in 1888 (the "warm year") (M.T.— $63.9^{\circ}$ ). In 1884, the M.T. was  $61.0^{\circ}$ ; in 1883 it was as low as  $57.3^{\circ}$ ; in 1880, it was  $58.7^{\circ}$ . From this, 1887 proves to have been the warmest since the present records commenced, whilst July, 1888, was almost the coldest.

The mean height of the barometer was 29.694 inches, or .030 inch below the corrected average value for July—namely, 29.715 inches. The mercury marked 30.338 inches at 9 a.m. of the 20th, and fell to 29.936 inches at 9 p.m. of the 7th. The observed range of atmospheric pressure was, therefore, .0942 inches—that is, a little less than an inch. The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was  $57.8^{\circ}$ , or  $0.4^{\circ}$  above the value for June, 1890. Using the formula, Mean Temp.=min. + (max.—min.  $\times$  .465), the value was  $57.7^{\circ}$ , or  $2.5^{\circ}$  below the average mean temperature for July, calculated in the same way, in the twenty-five years, 1868-89, inclusive ( $60.6^{\circ}$ ). The arithmetical mean of the maximal and minimal readings was  $58.1^{\circ}$ , compared with a twenty-five years' average of  $60.6^{\circ}$ . On the 13th, the thermometer in the screen rose to  $72.6^{\circ}$ —wind W.S.W.; on the 5th the temperature fell to  $44.4^{\circ}$ —wind, N. The minimum on the grass was  $41.0^{\circ}$  on the latter date, and also on the 10th. The rainfall was 2,174 inches, distributed over 24 days. The average rainfall for July in the twenty-

five years, 1855-59, inclusive, was 2429 inches, and the average number of rainy days was 172. The rainfall therefore, was somewhat below the average, while the rainy days were much above it. In 1859 the rainfall in July was very large—6057 inches on 24 days; in 1871 also 4391 inches fell on 28 days. On the other hand, in 1870, only 539 of an inch was measured on 8 days; in 1869, the fall was only 739 of an inch on 8 days, and in 1868, only 741 of an inch fell on but 5 days.

High winds were noted on many days, but attained the force of a moderate gale on only two occasions—viz., the 14th and 23rd. Temperature reached or exceeded 70° in the screen on only 4 days. In July, 1857, temperature reached or exceeded 70° in the screen on no fewer than 17 days. In July, 1858, the maximum was 68.7°.

At the beginning of the month the weather was, if possible, more broken, cold and showery than in the previous few weeks. Heavy showers fell almost daily, the wind blew strongly at times and from more northerly and colder points than of late, the amount of cloud continued large by day; while the nights were often clear and very cold for the season. On Friday, the 4th, an area of low pressure advanced to the English Channel and South of England from W.S.W. It caused gales and heavy rain in the S.E. of England at night, when clear cold weather held in Ireland. The week closed with a rising barometer, a northerly wind, and a clearing sky.

During the week ending Saturday, the 12th, the weather showed no improvement, but rather the reverse. Cloudy skies, very low temperatures, raw north-westerly winds, and frequent rains or showers made up the record of a most unseasonable period. Numerous areas of low pressure, or their subsidiaries, travelled across the west and north-west of Europe—for the most part in a north-easterly direction—keeping the weather in a very unsettled, broken state. On Monday, the 7th, a downpour of rain, exceeding an inch, occurred over the greater part of Scotland, and the Grampians and other heights were covered with snow as in October. Even at Parsonstown in Central Ireland the thermometer sank to 35° in the screen on two consecutive nights during the week, and in Dublin the mean temperature for the week was 7° below the average. In this city the mean atmospheric pressure was 29.839 inches. The corrected mean temperature was 54.2°; the mean dry bulb temperature at 9 a.m. and 9 p.m. was 54.5°. Rain was measured on six days, the total quantity being 448 inch.

The weather of the week ending Saturday, the 18th, was generally warmer and finer, although far from settled, especially in the south of England where severe thunderstorms occurred on Thursday, the 17th, accompanied by torrents of rain. On the whole, the barometer remained—as in past weeks—low over the North of Europe, and several subsidiary depressions travelled across France and England, causing the electrical disturbances just mentioned. In Dublin a short spell of summer heat occurred on Sunday, when the thermometer rose to 72° in the screen. Early next morning the wind rose to a fresh gale from S.W., and this was followed in turn by heavy showers on the afternoons of both Monday and Tuesday. Temperature was at this time rising fast on the Continent, so that on Thursday readings of 84° were recorded in Paris, Berlin, and Brussels, while 89° was touched at Lyons. In the evening violent thunderstorms raged over the North of France, the South of England, and Belgium—179 inches of rain fell during the storm in London, 161 inches at Cambridge, and 162 inches in Paris. This day was very fine in Dublin. In Dublin the mean barometer was 29.891 inches, the mean temperature was 58.4°, the mean dry bulb readings at 9 a.m. and 9 p.m. being 58.2°. The screened thermometers rose to 72.6° on Sunday—the maximum of the month. Rain was recorded on five days, the total measurement being 487 inch.

Although far from settled, the weather of the week ended Saturday, the 26th, was finer and warmer than for many weeks past. The barometer was throughout high off the S.W. and S. of Ireland, while several extensive areas of low pressure travelled eastwards across Northern Europe. Hence strong N.W. and W. winds prevailed almost daily. After a moderate rainfall on Sunday evening three blustering, but chiefly dry, days followed. Thursday was very fine, but in the evening dense sprays of cirrus cloud shot up across the sky from W., ushering in a depression, with unsettled weather which lasted to the close of the week. In Dublin the mean height of the barometer was 30.101 inches, pressure ranging from 30.323 inches at 9 a.m. of Sunday (wind, N.W.) to 29.830 inches, at 9 a.m. of Saturday (wind, W.S.W.). The corrected mean temperature was 61.3°; the mean dry bulb temperature at 9 a.m. and 9 p.m. being 60.7°. Rain was registered on four days, the total measurement being 320 inch, of which 376 inch was entered to Friday.

The last five days were changeable and showery.

The rainfall in Dublin during the seven months ending July 31st has amounted to 15,557 inches on 118 days, compared with 13,146 inches on 112 days during the same period in 1859, 15,994 inches on 109 days in 1858, 7,935 inches on 80 days in 1857, and a 25 years' average of 14,733 inches on 112.6 days.

At Knockdhuim, Greystones, Co. Wicklow, the rainfall in July was 1,489 inches, distributed over 18 days. Of this quantity 200 inch fell on the 7th, and 210 inch on the 31st.

**AUGUST.**—Except for a fine warm period extending from the 2nd to the 5th inclusive, and for a few isolated fine, but cool, days afterwards, this month proved showery, cold, and equally—the reduction of temperature below the 21st being especially remarkable. The prevailing wind was N.W. and temperature was 2.3° below the average. Happily, near Dublin, there were no torrential rains as in August, 1859, in which month 1,300 inches fell on the 10th and 1,962 inches on the 19th; but the frequency of the showers chilled the atmosphere and delayed the harvest.

In Dublin the mean temperature (57.2°) was decidedly below the average (59.7°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 36.8°. In the twenty-five years ending with 1880, August was coldest in 1881 (M. T.—57°), and warmest in 1871 (M. T.—62°). In 1885, the M. T. was only 57.1°; in 1879 (the "cold year"), it was 57.7°; in 1857, it was 60.3°; in 1858, it was 58.2°; and in 1859, 58.6°.

The mean height of the barometer was 29.878 inches, or 0.019 inch below the corrected average.

value for August—namely, 29.897 inches. The mercury marked 30.291 inches at 9 p.m. on the 31st, and fell to 29.269 inches at 4.30 p.m. of the 20th. The observed range of atmospheric pressure was, therefore, 1.022 inches—that is, a little more than an inch. The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 56.8, or 1.9° below the value in August, 1888 and 1889, and 1.3° below the value for July, 1890. Using the formula,  $\text{Mean Temp.} = \text{max.} + (\text{max.} - \text{min.}) \times .47$ , the value was 56.9°, or 2.4° below the average mean temperature for August, calculated in the same way, in the twenty-five years, 1865–89, inclusive (59.3°). The arithmetical mean of the maximal and minimal readings was 57.2°, compared with a twenty-five year's average of 59.7°. On the 4th, the thermometer in the screen rose to 74.8°—wind, S.W.; on the 31st the temperature fell to 41.5°—wind, N. The minimum on the grass was 35.5° on the latter date. The rainfall was 2790 inches distributed over 19 days. The average rainfall for August in the twenty-five years, 1865–89, inclusive, was 2.625 inches, and the average number of rainy days was 15.5. The rainfall therefore, was slightly less than the average, while the rainy days were considerably in excess of the average. In 1874, the rainfall in August was very large—4946 inches on 18 days—and in 1868 also 4745 inches fell on, however, only 13 days; but the heaviest downpour in August occurred in 1889, when 5747 inches were registered on 22 days. On the other hand, in 1884, only 777 inch was measured on 8 days. In 1887, 1.520 inches of rain fell on 16 days, and in 1888, 1.270 inches on 12 days.

High winds were noted on as many as 11 days, and attained the force of a gale on two occasions—namely, the 18th and 22nd. The atmosphere was foggy on the 1st. Lightning was seen on the 18th, and a thunderstorm, with hail, occurred at Greystones, Co. Wicklow, on the 26th. Temperature reached or exceeded 70° in the screen on only 2 days, the 4th and 5th—or 8 fewer than in August, 1887, and one more than in August, 1888. Hail fell on the 23rd.

On Friday, the 1st, the unexpected approach of a shallow depression caused very wet inclement weather.

At the commencement of the week ending Saturday, the 9th, the weather was very warm, temperature having risen to 74.8°, and generally fair. The arrival of a shallow depression on Wednesday caused dull weather with drizzling rain at first, but the evening was beautifully fine. Thursday was clear and fine, with easterly wind. Friday was fine and warm, but a dense haze prevailed during the whole day. Saturday was fine but cloudy, with fresh to strong north-easterly wind. The barometer fell slowly during Thursday and Friday, and quickly on Saturday. The mean height of the barometer in Dublin during this week was 30.133 inches. The corrected mean temperature was 61.8°; the mean of the dry bulb thermometer at 9 a.m. and 9 p.m. daily being 51.4°. The rainfall equalled 216 inch on two days.

In most respects the weather of the period ending Saturday, the 16th, presented a marked contrast to that of the previous week. Low and varying atmospheric pressure, a reduced temperature, clouds, squally westerly (N.W. to S.W.) winds, and frequent showers took the place of the high and steady pressure, warmth and sunshine, and easterly winds so prevalent in the first week of the month. During the first few days a thunderstorm depression travelled slowly in an east-north-easterly direction across England and the North Sea; while a deep depression passed over Ireland and Scotland from S.W. to N.E. on Thursday night and Friday. This latter disturbance caused fresh S.W. to W. gales and a very general rainfall—the precipitation being greatest in the N.W. of Ireland. In Dublin the mean height of the barometer was 29.693 inches. The corrected mean temperature was 57.4°. The mean dry bulb reading at 9 a.m. and 9 p.m. was 57.0°. Rain fell to the amount of 459 inch on five days. Sheet lightning was seen on Friday night, the 15th.

The weather of the third week (16th–22nd, inclusive) was in keeping with that of almost the whole season—it was changeable, cool, squally, and showery. A very heavy fall of rain took place on the evening of Friday, the 22nd, and hail fell on Saturday, the 23rd. The general distribution of air-pressure was this—lowest off the N.W. of Norway, secondary depressions crossing the United Kingdom and France from the south-westward, a ridge of comparatively high pressure extending from the Peninsula across Central Europe. On Monday night and Tuesday a thunderstorm depression caused heavy rains in the S. and S.E. of England, but at this time the weather was chiefly fine in Ireland. On Friday, however, a depression advanced rapidly from S.W. across this country, and heavy rains resulted. In Dublin, the mean height of the barometer was 29.869 inches. The corrected mean temperature was 56.5°; the mean dry bulb temperature at 9 a.m. and 9 p.m. was 56.1°. Rain fell on five days, the total measurement being 1.038 inches, of which 631 inch was referred to Friday. Hail fell on Saturday.

The week ended Saturday, the 30th, was again one of broken weather—cold, squally, and very showery. The barometer was generally low in the N., relatively high in the S., and several well-marked cyclonic systems passed in an easterly or north-westerly direction across North-Western Europe. At 8 a.m. of Thursday, the 29th, the barometer was as low as 28.92 inches at Haparanda, the Gulf of Bothnia. On Friday, the 29th, a decided and general increase of pressure took place, gradients became slight, and the weather improved, although temperature remained low. In Dublin rain fell in greater or less quantity daily. Falls of hail occurred near the city on Sunday and Tuesday—a thunderstorm passing over Greystones, Co. Wicklow, on the afternoon of the latter day. Although conditions were quieter on Friday and Saturday, yet evaporation showers fell locally in Dublin, chiefly owing to the prevalence of variable sea breezes during the daytime. In Dublin the mean height of the barometer was 29.733 inches, pressure ranging from 29.269 inches at 4.30 p.m. of Tuesday (wind, W.N.W.), to 30.180 inches at 9 p.m. of Saturday (wind, N.). The corrected mean temperature was 51.3°—the mean dry bulb temperature at 9 a.m. and 9 p.m. being 51.2°. The rainfall equalled 640 inch, distributed over six days. On Monday 253 inch was measured. The week closed with signs of more settled weather, and Sunday, the 31st, was beautifully fine, although very cool.

The rainfall in Dublin during the eight months ending August 31st has amounted to 18-333 inches on 137 days compared with 9-435 inches on 96 days during the same period in 1887, 17-264 inches on 121 days in 1888, 18-803 inches on 134 days in 1889, and a 25 years' average of 17-533 inches on 128-1 days.

At Knockdolian, Greystones, Co. Wicklow, the rainfall in August, 1890, was 2-216 inches, distributed over 16 days. Of this quantity 400 inch fell on the 10th, and 300 inch on the 24th.

**SEPTEMBER.**—As in 1888 and 1889, so in 1890, September proved a fine month, with a high mean barometer. The prevailing winds were from warm quarters—chiefly S.W. There was no excessive rainfall, and temperature was remarkably high. From the 5th to the 15th, inclusive, conditions were anticyclonic, and the weather was summerlike. On the 20th a violent gale occurred, accompanied by very heavy rain. Taken, however, as a whole, the month was very favourable from an agricultural as well as from a health point of view.

In Dublin the mean temperature (59-6°) was much above the average (55-8°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 58-9°. In the twenty-five years ending with 1889, September was coldest in 1886 and in 1881 (M. T. = 53-0°), and warmest in 1885 (M. T. = 61-4°). In 1880, the M. T. was as high as 58-6°; in the year 1879 (the "cold year"), it was 54-8°; in 1887, it was 54-0°; in 1888, it was 54-4°, and in 1889, 55-8°, or exactly the average. So warm a September has not occurred for a quarter of a century.

The mean height of the barometer was 30-061 inches, or 0-151 inch above the average value for September—namely, 29-910 inches. The mercury rose to 30-467 inches at 9 a.m. of the 6th, and fell to 29-237 inches at 9 p.m. of the 20th. The observed range of atmospheric pressure was, therefore, 1-230 inches—that is, a little less than one inch and a quarter. The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 58-9°; or 2° above the value for August, 1890. Using the formula  $\text{Mean Temp.} = \text{min.} + (\text{max.} - \text{min.}) \times \frac{1}{476}$ , the value was 59-3°, or 2-3° above the average mean temperature for September, calculated in the same way, in the twenty-five years 1865-89, inclusive (55-5°). The arithmetical mean of the maximal and minimal readings was 59-6°, compared with a twenty-five years' average of 55-8°. On the 7th, the thermometer in the screen rose to 71-2°—wind, S.E.; on the 23rd the temperature fell to 48-8°—wind, N.W. The minimum on the grass was 42° on the 1st and 19th. The rainfall was 2-469 inches distributed over 14 days—the rainfall was somewhat above and the rainy days were somewhat below the average. The average rainfall for September in the twenty-five years, 1865-89, inclusive, was 2-176 inches, and the average number of rainy days was 14-7. In 1871, the rainfall in September was very large—4-048 inches on, however, only 13 days. On the other hand, in 1865, only 0-56 inch was measured on but 3 days. In 1888, the rainfall was only 728 inch on 10 days, and in 1889, 1-043 inches fell on 13 days.

High winds were noted on as many as 14 days, but attained the force of a gale on only three occasions—the 20th, 26th, and 30th. A solar halo appeared on the 10th, and sheet lightning was seen on the night of the 14th.

The first week happily witnessed a marked improvement in the weather, which became much warmer and drier—particularly in the east of Ireland and the S.E. and S. of England. This fortunate change was brought about by the establishment and development of an anticyclone, which had already appeared over Ireland on Saturday, August 30. At the beginning of the period temperature was very low and the wind was northerly. On Monday, September 1, however, a depression in the far N.W. caused a S.W. wind, which brought with it warmth and rain. The downpour was heavy in the N. and N.W. of Ireland, but moderate on the east coast. It blew freshly from S.W. or W. until Thursday, after which day light, variable winds set in. The week closed with beautiful weather. At Munich 7-10 inches of rain fell in the 7 days ending at 9 a.m. of Friday, the 5th. In Dublin the mean height of the barometer was 30-282 inches, pressure ranging from 30-104 inches, at 9 a.m. of Tuesday (wind, S.W.), to 30-467 inches at 9 a.m. of Saturday (wind, N.). The corrected mean temperature was 59-0°—the mean dry bulb reading at 9 a.m. and 9 p.m. being 59-7°. The rainfall was 2-43 inch on 3 days. Of this quantity 1-02 inch was referred to Wednesday, the 3rd, when the fall at Greystones was 840 inch.

The improvement in the weather observed in the first week developed in, and continued through, the second week. It is true that strong winds were felt at times, while rain fell in the N.W. of Ireland and over the greater part of Scotland on several days; but in the E. and S. of Ireland and almost throughout England the week was practically rainless. At the beginning the centre of a well-formed anticyclone was found over Lincolnshire, where the height of the barometer at this time slightly exceeded 30-50 inches. This system subsequently moved slowly southwards, causing southerly winds and high temperature in Ireland and afterwards less settled conditions in the N.W. of this country. On Wednesday a new, but not so pronounced an area of high pressure began to spread over Ireland from the westward, whence it continued its course in an easterly direction, reaching England on Friday. Under its influence a further spell of fine weather was enjoyed. In Dublin the mean height of the barometer was 30-279 inches. The corrected mean temperature was 60-0°. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 59-4°. There was no measurable rainfall at this station, although light showers fell on Tuesday.

The fine weather experienced during the previous two weeks came to end in the course of the third seven-day period, which—having opened fair and warm—closed with a tempest and downpour of rain. This unfortunate change was brought about by the retreat of the anticyclones towards N.E., while barometrical depressions of increasing intensity encroached more and more upon the British Isles as the week advanced. Even on Sunday signs of the unoward change were not wanting in Ireland, where a southerly wind freshened, cloud increased, and sheet lightning was seen after dark. At night also rain fell heavily on the W. coast. It was not until Wednesday morning

however, that the wet weather reached the E. coast, and on this and the following day thunderstorms occurred in England. The most extensive and deepest of the series of depressions arrived on Saturday, which proved a day of storm and rain. In Dublin the mean height of the barometer was 29.776 inches, pressure decreasing intermittently from 30.154 inches at 9 a.m. of Sunday (wind, S.S.E.), to 29.237 inches at 9 p.m. of Saturday (wind blowing a gale from S. by E.). The corrected mean temperature was 57.5°. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 58.0°. Rain fell on five days to the amount of 1.728 inches, .434 inch being measured on Wednesday, .310 inch on Friday, and .578 inch on Saturday. Sheet lightning was seen on Sunday night. The rainfall for the week at Knockdolian, Greystones, was 2.010 inches.

Opening with storm and rain, the fourth week (21st-27th inclusive) closed in sunshine and the warmth of midsummer—the intervening period being one of cloud and sunshine; passing showers and fresh or equally westerly winds. At 8 a.m. of Sunday the centre of a cyclone of great energy was found over Mayo, whence it had advanced from Kerry, during the previous night. The barometer read 29.04 inches at Belmullet, but had been down to 28.61 inches at Valentia Island, in Kerry, at 6 p.m. the previous day. Fresh southerly (S.E. to S.W.) gales and heavy rain accompanied the disturbance, while thunderstorms occurred in England and France on its outskirts. The system travelled slowly away to N.N.E., and finally dispersed. On Thursday a large anticyclone advanced from the Atlantic over our southern districts, while depressions skirted our northern coasts. The result was a moderate gale from W. and showers at exposed stations. On Saturday the weather became brilliant and very warm. In Dublin the mean height of the barometer was 30.027 inches. The corrected mean temperature was 58.9°. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 57.5°. The rainfall was .128 inch on 3 days; of this amount .052 inch fell on Sunday. A lunar rainbow was seen at Greystones on the evening of Wednesday, the 24th.

The closing days of the month were hazy, and showers fell at times. On the night of the 20th there was a fresh S.W. gale, and rain fell heavily.

The rainfall in Dublin during the nine months ending September 30th has amounted to 20.855 inches on 131 days, compared with 10.968 inches on 112 days during the same period in 1887, 17.992 inches on 131 days in 1888, 19.935 inches on 147 days in 1889, and a twenty-five years' average of 19.734 inches on 142.8 days.

At Knockdolian, Greystones, County Wicklow, the rainfall in September, 1890, was 9.155 inches, distributed over 11 days. Of this quantity .760 inch fell on the 17th, and .750 inch on the 20th.

**OCTOBER.**—October, 1890, will be remembered as one of the driest, finest, and mildest on record in the east of Ireland. In the west of this country and in Scotland it was much less favourable, the weather being often equally cold and wet. During the first fortnight temperature was almost always above the average. On the 25th a cold period set in, which culminated in Ireland on the 27th and in England on the 28th—the thermometer in the screen sinking to 30° at Loughborough, 28° at Oxford and Dungeness, and 24° in London. This premature "cold snap" was followed by mild, dull, and damp weather to the end of the month. As regards atmospheric pressure, the general tendency was for an area of high barometer (anticyclone) to stretch across Ireland, England, and Central Europe, while areas of low pressure swept eastwards across Northern Europe.

In Dublin the mean temperature (51.7°) was considerably above the average (49.7°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 50.9°. In the twenty-five years ending with 1889, October was coldest in 1880 (M.T. = 45.4°), and in 1885 (M.T. = 45.5°), and warmest in 1876 (M.T. = 53.1°). In 1886, the M.T. was as high as 52.0°; in the year 1870 (the "cold year"), it was 49.7°. In 1887, it was as low as 47.3°; in 1888, it was 49.1°, and in 1889 it was only 48.1°.

The mean height of the barometer was 30.109 inches, or .0209 inch above the average value for October—namely, 29.840 inches. The mercury rose to 30.559 inches at 9 p.m. of the 22nd, and fell, to 29.486 inches at nine a.m. of the 26th. The observed range of atmospheric pressure was therefore, 1.073 inches—that is, a little less than an inch and one tenth.

The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 50.9°, or 8.0° below the value for September, and 5.6° below that for August, 1890. The arithmetical mean of the maximal and minimal readings was 51.7°, compared with a twenty-five years' average of 49.7°. Using the formula,  $\text{Mean Temp.} = \text{Min.} + (\text{max.} - \text{min.}) \times .486$ , the value was 51.3°, or 2.0° above the average mean temperature for October, calculated in the same way, in the twenty-five years, 1865-89, inclusive (49.5°). On the 5th the thermometer in the screen rose to 61.2°—wind, W.S.W.; on the 27th the temperature fell to 34.2°—wind, N.W. The minimum on the grass was 28.9° also on the 27th; on three nights the thermometer sank below 32° on the grass.

The rainfall was only .639 inch, distributed over 11 days—both rainfall and rainy days were largely below average. The average rainfall for October in the twenty-five years, 1865-89, inclusive, was 3.106 inches, and the average number of rainy days was 17.6. In 1890 the rainfall in October was very large—7.858 inches on 15 days. In 1875, also, 7.048 inches fell on 26 days. On the other hand, in 1884, only .634 inch was measured on but 14 days, and in 1888 only .336 inch on 15 days. In 1888, the rainfall was 1.237 inches on 16 days, and in 1889 no less than 4.853 inches fell on 22 days. From these figures, October, 1890, proves to have been the driest on record for more than a quarter of a century at least.

A lunar halo was seen on the 23rd. High winds were noted on 14 days, best attained the force of a gale on only one occasion—the 15th. The atmosphere was more or less foggy in Dublin on the 8th, 9th, 11th, 12th, and 22nd. Lightning was seen on the evening of the 20th. Snow and sleet fell on the morning of this same day, and hail on the 15th.

A great dip in temperature accompanied a ridge of high pressure which travelled from W. to E. across Ireland and England on Wednesday and Thursday, the 1st and 2nd, but the thermometer soon recovered itself as a fresh S.W. wind sprang up.

The general character of the weather during the week ending Saturday, the 11th, was fine in the south, unsettled and rainy in the far north, cold in Scandinavia. The barometer stood high in an anticyclone stretching east and west across Central Europe, and interrupted only for a time on Tuesday, the 7th, by the appearance of a depression over Ireland, which subsequently moved southwards and underwent considerable modifications both in size and intensity. This system caused the only bad weather of the period in Ireland and England—a heavy fall of rain occurring on the 7th over the greater part of both countries. In the rear of this disturbance the barometer rose with great rapidity, and the anticyclone became re-established, lasting to the end of the week and ensuing beautiful weather. Winter seemed to be setting in with considerable severity over Northern Europe as the week passed by. In Dublin the mean height of the barometer was 30.210 inches. The corrected mean temperature was 55.4°. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 54.0°. The thermometers in the screen rose to 65.2° on Sunday and fell to 59.9° on Thursday. Rain fell to the amount of .036 inch. The prevailing wind was W.S.W.

At first fair and bright, the weather of the week ended Saturday, the 18th, afterwards became unsettled—squally, showery, and cold. Towards the end of the week an improvement took place, so that the period under review proved generally favourable. During the first three days a large anticyclone over Central Europe included in its influence England and the southern half of Ireland, while conditions were cyclonic over the northern portion of the British Islands. Dense fogs occurred at this time in England, where temperature was very low by night and in the mornings. On and after Tuesday, the anticyclone retreated southwards, and an extensive V-shaped depression encroached upon Western Europe. In the rear of its axis, strong N.W. winds sprung up, accompanied by showers of cold rain, hail, and some sleet. At several English stations thunder and lightning occurred on Wednesday and Thursday. On Friday the weather improved and Saturday was fine. In Dublin the mean pressure was 30.064 inches. The corrected mean temperature was 49.4°. The mean dry bulb reading at 9 a.m. and 9 p.m. was 48.8°. Rain fell to the amount of .164 inch, .082 inch being measured on Wednesday, the 15th, when hail was also observed. The prevailing winds were W. and N.W.

Dull, but otherwise favourable and mild, weather prevailed during the greater part of the week ended Saturday, the 25th. On Friday conditions became less settled and a considerable rainfall occurred on Saturday morning. At first an anticyclone lay over Ireland, while a very extensive and deep depression had its centre over the Baltic Provinces of Russia. The winds were northwesterly and the weather was fine in Ireland. Four mild, cloudy days followed, with light drizzling showers from time to time in places. On Tuesday night a remarkable "chill" took place on the Continent and over the S.E. of England—at Belfast, in Alse, the thermometer sank from 61° to 23° in less than twenty-four hours. On Friday the anticyclones moved away southwards, and large depressions began to encroach more and more upon the British coasts—the wind became to W.S.W. and freshened considerably with rain or passing showers. In Dublin the mean height of the barometer was 30.235 inches, pressure rising to 30.550 inches, at 9 p.m. of Wednesday (wind, W.N.W.), the maximum of the month. The corrected mean temperature was 52.2°. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 51.3°. The thermometers in the screen fell to 49.8° on Sunday and rose next day to 53.5°. The rainfall was .274 inch; there were three rainy days, and the heaviest fall in 24 hours was .164 inch on Saturday. The prevailing wind was northwesterly.

The weather was in every respect most changeable during the closing period of the month (26th-31st, inclusive). At the beginning, the centre of an extensive and deep depression was found over the South of Sweden, while subhurricanes travelled southwards across the British Islands. Very unsettled weather prevailed, equally northerly winds, with showers of wet snow and hail being reported from many stations. In Dublin sleet and snow fell on the morning of Sunday, the 26th, and the mountains were white with snow. After nightfall lightning was seen, and thunder and lightning occurred in several places. The cold culminated in a severe frost over England on Monday night and Tuesday morning, the 27th and 28th. The lowest temperatures recorded in the screen were 20° at Loughborough, 23° at Dungeness and Oxford, and 24° in London. This premature cold was followed by an extraordinary and rapid rise of temperature, amounting in 24 hours to 25° at Loughborough, 24° at York and Oxford, 23° at Shields, and 22° in London. The remainder of the period was mild, the air being often damp.

The rainfall in Dublin during the ten months ending October 31st has amounted to 21.404 inches in 162 days, compared with 12.360 inches on 133 days during the same period in 1887, 19.218 inches on 147 days in 1888, 24.789 inches on 169 days in 1889, and a twenty-five years average of 23.640 inches on 160 days.

At Knockdrum, Greystones, Co. Wicklow, the rainfall in October, 1890, was only .000 inch, distributed over 13 days. Of this quantity .160 inch fell on the 6th, and .120 inch on the 14th. The rainfall at Greystones in October, 1880, was no less than 6.935 inches on 22 days, or more than eleven times as great as the fall in October, 1890.

NOVEMBER.—A wet, stormy, cheerless month, reminding one of November, 1888, which was the wettest and most stormy November observed in Dublin for more than a quarter of a century. The weather remained open until the 24th, when a spell of snowstorms and bitter cold set in with peculiar suddenness. On the 19th the thermometer rose in Dublin to 63° in the screen; on the 29th it fell to 26.3°. On several evenings bright "afterglows" were seen. A snowstorm on the night of the 26th-27th was the heaviest experienced since the memorable storm of January 17, 1881.

In Dublin the mean temperature (45.3°) was somewhat above the average (44.7°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 44.3°. In the twenty-five years ending with 1880, November was coldest in 1878 (M.T. = 35.2°), and in 1870 (M.T. = 42.2°), and warmest in 1881 (M.T. = 50.3°).

In 1886 and in 1889, the M.T. was as high as  $40^{\circ}4$ ; in the year 1879 (the "cold year"), it was  $43^{\circ}9$ ; in 1887, it was as low as  $42^{\circ}6$ ; and in 1888, it was as high as  $47^{\circ}5$ .

The mean height of the barometer was 29.827 inches, or 0.033 inch below the average value for November—namely, 29.860 inches, and 0.357 inch below the mean pressure in November, 1889—viz., 30.184 inches. The mercury rose to 30.403 inches at 9 p.m. of the 19th and fell to 28.737 inches at 8 p.m. of the 6th. The observed range of atmospheric pressure was, therefore, 1.666 inches—that is, nearly an inch and seven-tenths.

The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was  $44^{\circ}3$ , or  $0.6^{\circ}$  below the value for October, and  $14^{\circ}6$  below that for September, 1890. The arithmetical mean of the maximal and minimal readings was  $45^{\circ}3$ , compared with a twenty-five years' average of  $44^{\circ}7$ . On the 19th the thermometer in the screen rose to  $63^{\circ}0$ —wind, S.W.; on the 23rd the temperature fell to  $29^{\circ}3$ —wind, W. The minimum on the grass was  $22^{\circ}0$ , also on the 29th.

The rainfall was as much as 4.212 inches, distributed over 27 days—both rainfall and rainy days were therefore largely in excess of the average values. The average rainfall for November in the twenty-five years, 1865-89, inclusive, was 2.452 inches, and the average number of rainy days was 17.0. In 1876 the rainfall in November was large—3.614 inches on 20 days; in 1872, also, 3.414 inches fell on 24 days; in 1887, 3.012 inches fell on 18 days, and in 1888, 6.549 inches fell on 26 days. On the other hand, the rainfall in 1886 was only .929 inch on 9 days; in 1870, only 1.218 inches were measured on but 11 days, and in 1879 only 1.251 inches on but 10 days. The excess of the rainfall in 1890, and the equally marked deficit in 1889, are evident from these figures.

A solar halo was seen on the 13th. High winds were noted on as many as 12 days, and attained the force of a gale on 5 occasions—the 2nd, 6th, 14th, 23rd and 30th. The atmosphere was more or less foggy in Dublin on the 13th, 17th, 18th, and 20th. Hail fell on the 24th and four following days. Sleet and snow fell on the 26th, 27th, and 28th.

Very rough, unsettled, rainy weather prevailed during the greater part of the week ended Saturday, the 8th. There was, however, some clear intervals, Wednesday and Friday in particular being fine and bright. A succession of cyclonic systems swept across Western Europe, accompanied by gales and rains. Of these the deepest were observed on Sunday and Thursday. At 8 a.m. of the former day the barometer was down to 28.69 inches at Sunbergh Head, in the Shetlands, while it stood at 30.22 inches at Lisbon. Needless to say there were heavy S.W. to N.W. gales over the British Isles. During the next three days a complex low-pressure system travelled south-eastwards across these islands to Germany. But it was on Thursday that the most destructive and fatal disturbance of the week advanced from the Atlantic. Even in Dublin the barometer fell to 28.737 inches at 8 p.m. In front of the centre of this depression southerly gales prevailed, in its rear whole gales from W., N.W., and N. were experienced. A new disturbance caused a heavy rainfall on Saturday. In Dublin the mean height of the barometer was only 29.425 inches—the highest reading was 29.876 inches at 9 p.m. of Wednesday (wind, N.W.); the lowest was 28.737 inches twenty-three hours later (wind, W.). The corrected mean temperature was  $40^{\circ}8$ . The mean dry bulb reading at 9 a.m. and 9 p.m. was  $44^{\circ}9$ . The rainfall was .969 inch on seven days. The wind varied between S.W. and N.W.

Very changeable, rainy weather prevailed in Ireland almost throughout the second week also. Conditions were more favourable in England, especially in the S.E. and E. of that country. The general distribution of atmospheric pressure was: anticyclonic over Northern Europe and also over the Peninsula—cyclonic in the British Islands and their neighbourhood. The centres of low pressure were usually found off the W. and N.W. of Ireland and of Scotland; but on Sunday such a centre lay over the N.E. of England, while very heavy rain fell on the east coast of Scotland, in Cheshire, and in North Wales. On Monday night there was a downpour in and about Dublin. Thursday and Saturday were fine, bright days, and on Friday—with a S.W. wind, clouds and rain—came a great rise of temperature—from  $32^{\circ}2$  to  $60^{\circ}5$  in a few hours. An anticyclone spread over Ireland on Saturday. In Dublin the mean height of the barometer was 29.678 inches. The corrected mean temperature was  $44^{\circ}8$ . The mean dry bulb temperature at 9 a.m. and 9 p.m. was  $42^{\circ}5$ . Rain fell on six days to the amount of 1.167 inches, the heaviest fall in 24 hours being .625 inch on Monday. The wind varied between S. and N.W.

The remarkable mildness of the weather throughout Western Europe was the chief feature of the third week. On Wednesday the thermometer rose above  $60^{\circ}$  in England and Ireland and to that point in Scotland. All through the week an area of high atmospheric pressure held over France and Germany, while depressions of no great intensity passed north-eastwards along the coasts of Ireland, Scotland, and Norway. Hence there was a continued prevalence of S.W. winds, accompanied by high temperature and occasional but not excessive rains. In Russia snow fell heavily, and, as a result, severe frost set in, the thermometer sinking to  $-11^{\circ}$  Fahr., or  $48^{\circ}$  below freezing point, at Archangel on Tuesday, and at Moscow to  $-11^{\circ}$  on Wednesday and  $-12^{\circ}$  on Friday. In Dublin a very dense vapour-fog was observed on Tuesday, but next day the temperature rose to  $63^{\circ}$  in the screen. This was the highest temperature recorded in Dublin in November since the 6th of this month in the year 1872. In Dublin the mean height of the barometer was 30.205 inches, pressure rising to 30.403 inches at 9 p.m. of Wednesday (wind, S.W., light). The corrected mean temperature was  $50^{\circ}4$ , or  $61^{\circ}$  above that of the previous week. The mean dry bulb temperature at 9 a.m. and 9 p.m. was  $50^{\circ}3$ . Rain fell on five days to the amount of .458 inch.

The week ended Saturday, the 29th, witnessed an extraordinary change all over western and central Europe from the abnormally mild weather previously so prevalent to heavy snowstorms and extreme cold. The way in which this change was brought about is noteworthy. On Sunday the centre of a vast and deep depression, in which the barometer was down to 28.70 inches, lay over the Christiania Fjord in Norway; south of the centre warm S.W. and W. gales were blowing, while to the northward of it an inrush of intensely cold E. wind took place. This cold current

curved southwards and swept over the British Isles as a keen N. wind on Monday, accompanied with heavy rain at first, and hail and snow afterwards. On Wednesday and Thursday Dublin was visited by the heaviest snowstorm which has been experienced in this city since January 17, 1881. In the suburbs the snow lay to the depth of from 7 to 8 inches. In the S.E. of England the fall was even greater, and a keen frost prevailed, the thermometer falling to  $17^{\circ}$  in the screen at Dungeness on Friday morning. In Dublin a thaw occurred on this day, but sharp frost prevailed on Saturday morning, when the minimum was  $26.3^{\circ}$ . The mean height of the barometer was 30.056 inches, pressure ranging between 29.325 inches at 9 p.m. of Sunday (wind, W. by N., strong), and 30.288 inches at 9 a.m. of Wednesday (wind, N.E., moderate). The corrected mean temperature was  $39.5^{\circ}$ , the mean dry bulb reading at 9 a.m. and 9 p.m. being  $38.3^{\circ}$ . The rainfall, which was largely in the form of snow and hail, measured 1.099 inches on seven days—the heaviest fall in 24 hours being .510 inch on Wednesday, the 26th.

Sunday, the 30th, was a day of storm and rain, and the snow rapidly disappeared under the influence of a S.W. gale and warm rain.

The rainfall in Dublin during the eleven months ending November 30th has amounted to 25708 inches on 189 days, compared with 15378 inches on 141 days during the same period in 1887, 25708 inches on 173 days in 1888, 25718 inches on 178 days in 1889, and a twenty-five years average of 25292 inches on 1774 days.

At Knockdolinn, Greystones, Co. Wicklow, the rainfall in November, 1890, was no less than 5370 inches distributed over 23 days. Of this quantity 1.000 inch fell on the 6th, and 790 of an inch on the 10th.

**DECEMBER.**—A very cold, dull, foggy month, with much cloud (76.3 per cent) and prevalent easterly winds (that is, winds from points between S.E. and N.E.) these conditions were determined by the persistence of an anticyclone to the eastward and north-eastward, while areas of low pressure occasionally skirted the western shores of Ireland, Scotland and Norway in their passage northeastward across the Atlantic Ocean and the Norwegian Sea. In central and south-eastern England intense frost was felt almost throughout the month, while the weather was at times open in Ireland and Scotland.

In Dublin the arithmetical mean temperature ( $39.2^{\circ}$ ) was decidedly below the average ( $41.3^{\circ}$ ); the mean dry bulb readings at 9 a.m. and 9 p.m. were  $38.9^{\circ}$ . In the twenty-five years ending with 1889, December was coldest in 1878 (M. T. =  $35.6^{\circ}$ ), and in 1876 (M. T. =  $36.3^{\circ}$ ), and warmest in 1865 (M. T. =  $40.2^{\circ}$ ). In 1886 the M. T. was as low as  $37.9^{\circ}$ ; in the year 1879 (the "cold year"), it was also  $37.9^{\circ}$ . In 1887 the M. T. was  $39.6^{\circ}$ ; in 1888 it was  $40.8^{\circ}$ , and in 1889 it was  $42.8^{\circ}$ .

The mean height of the barometer was 30.025 inches, or 0.150 inch above the average value for December—namely, 29.875 inches. The mercury rose to 30.454 inches at 9 a.m. of the 26th, and fell to 29.185 inches at 9 p.m. of the 18th. The observed range of atmospherical pressure was, therefore, 1.269 inches—that is a little more than one inch and a quarter.

The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was  $38.9^{\circ}$ , or  $3.4^{\circ}$  below the value for November, and  $12.6^{\circ}$  below that for October, 1890. Using the formula, Mean Temp. =  $\frac{Max. + (max. - min. \times 5)}{2}$ , the value was  $39.3^{\circ}$ , or  $2.2^{\circ}$  below the average mean temperature for December, calculated in the same way, in the twenty-five years, 1865-89, inclusive ( $41.5^{\circ}$ ). The arithmetical mean of the maximal and minimal readings was  $39.2^{\circ}$ , compared with a twenty-five year's average of  $41.3^{\circ}$ . On the 1st the thermometer in the screen rose to  $35.9^{\circ}$ —wind, S.W.; on the 21st the temperature fell to  $24.1^{\circ}$ —wind, calm. The minimum on the grass was  $20.1^{\circ}$  also on the 21st. There were 8 days of frost in the screen and 23 days of frost on the grass.

The rainfall was 1.856 inches, distributed over 11 days. The average rainfall for December in the twenty-five years, 1865-89, inclusive, was 2.604 inches, and the average number of rainy days was 16.9. The rainfall, therefore, was decidedly below the average, while the rainy days were also much below it. In 1876 the rainfall in December was very large—7.468 inches on 22 days. In 1878, 4.138 inches fell on as many as 24 days; and in 1868 (which was otherwise a fine and dry year), 4.749 inches fell on as many as 37 days. On the other hand, in 1867, only 7.71 of an inch was measured on 13 days; and in 1871 the December rainfall was only 7.97 of an inch on 15 days. In 1885, only 7.42 of an inch of rain was measured on but 16 days, but in 1886 the rainfall was 3.348 inches, distributed over as many as 21 days. In 1887 (the "dry year"), the rainfall was 1.223 inches on 19 days; in 1888, it was 2.911 inches on 17 days, and in 1889, 1.554 inches fell on 15 days.

A lunar halo appeared on the 21st. High winds were noted on 10 days, but attained the force of a gale on only two occasions—the 18th and the 30th. The atmosphere was more or less foggy in Dublin on the 1st, 2nd, 8th, 9th, 10th, 19th, 20th, 21st, 24th, and 28th. Snow or sleet fell on the 19th, 27th, and 31st. Hail fell on the 7th, 10th, 27th, 29th, 30th, and 31st.

While the weather remained cold on the Continent and in the S.E., E., and centre of England, a spell of damp warmth was felt in Ireland, Scotland, Wales, and the N. of England in the earlier part of the period ending Saturday, the 6th. This was followed by keen easterly winds and lower temperatures generally after Tuesday, the 2nd. On Monday the 1st, a warm S.W. current swept over Ireland, Scotland, and Scandinavia round a depression near Bodø, in Norway, where the barometer was as low as 29.97 inches. On this day, temperature rose to  $53.9^{\circ}$  in Dublin and to  $57^{\circ}$  at Nairn and Leith. The thermometer now rose in the N. and fell in the S., a heavy downpour of rain occurred, and an easterly current took the place of the warm S.W. winds. The last three days were dry and bleak. The corrected mean temperature was  $45.4^{\circ}$ . The mean of the dry bulb readings at 9 a.m. and 9 p.m. was  $45.0^{\circ}$ . The screened thermometer rose to  $53.9^{\circ}$  on Monday. The rainfall was 1.182 inches on four days. Of this amount, 597 inch was registered on Tuesday. The wind was at first S.W., then calm, and finally N.E. to E.

Throughout the second week (7th–13th) an anticyclone lay over the North Sea, Denmark, and the Southern part of the Scandinavian Peninsula, affecting Germany, France, and England to a less extent. Depressions of no great depth were found over the Iberian Peninsula, and—on Wednesday and Thursday, the 10th and 11th—off the western coasts of Ireland and Scotland also. These barometrical conditions determined the weather of the week. Continuous hard frost held in Germany, Belgium, and the greater part of France. Cold weather and dense fogs prevailed in England; while it was milder—especially on Wednesday and Thursday—in Ireland and Scotland. On these days also considerable quantities of rain fell at most of the Irish stations. In Dublin the fall was only just perceptible—0.03 inch on Thursday. The mean height of the barometer was 30.042 inches. The corrected mean temperature was 39.3°—the mean of the dry bulb readings at 9 a.m. and 9 p.m. being 38.9°. The rainfall was only 0.02 inch on Thursday. The prevailing wind was S.E., but from time to time the air was calm, with smoke fog over the city.

Exceptionally severe weather continued to prevail during the week ended Saturday, the 20th, in Germany, France, and the greater part of England. In Ireland and Scotland the cold was less intense, but still considerable, especially towards the close of the period. At 8 a.m. of Sunday the thermometer read 14° at Loughborough, 16° at Oxford, 18° at Cambridge, and 19° in London. It was 39° in Dublin at the same time. At night a shallow depression formed over the British Islands, and the wind shifted from S.W. to N.W. and N.E. in Ireland, with some cold showers on Monday, rain in Scotland, and snow in most parts of England. On Thursday a deep V-shaped depression advanced over Ireland from the Atlantic, and caused a S.E. to S. gale, with heavy rain and sleet or snow at night. The wind shifted to N.W. in the rear of this system on Friday, when the sky cleared and frost set in with haze and fog in Dublin. Meanwhile heavy falls of snow occurred in England, after which the frost stiffened again, and winter seemed fully established as the week drew to a close. In Dublin the mean height of the barometer was 29.771 inches, pressure falling to 29.185 inches at 9 p.m. of Thursday (wind, S.S.E., a gale). The corrected mean temperature was 37.6°; the mean dry bulb temperature at 9 a.m. and 9 p.m. was 36.9°. The rainfall was 3.82 inch, on two days—0.58 inch falling as rain and sleet on the night of the 16th—19th, when the record at Knockdolian, Greystones, Co. Wicklow, was 3.50 inch, and that at Easton Lodge, Monkstown, Co. Dublin, was 6.00 inch.

The fourth was another week of inclement weather—interrupted in Ireland and Scotland by a spell of milder conditions on Monday and Tuesday, the 22nd and 23rd. The week opened with severe frost in parts of Great Britain and Ireland, the lowest temperatures at 8 a.m. of Sunday being 14° at Loughborough, 16° at York, 20° at Parsonstown, 23° at Cambridge, and 24° at Aberdeen, Liverpool, and Dublin. In and about the last-named city there was a thick and beautiful rime, and it froze all day. Towards evening a depression, edging in from the west, brought a southerly wind and higher temperature. At 9.30 p.m. a lunar halo was visible. Next day was mild and dull in Ireland—the thermometer marking 40° at Parsonstown at 8 a.m., or 20° higher than 24 hours previously. In England, however, the cold was on this day intense, among the 8 a.m. readings being these—Cambridge, 4°; Oxford, 9°; Loughborough, 10°; London, 15°; and York, 16°. On Tuesday, temperature again gave way in Ireland, but rose in England, although no decided thaw occurred. In Dublin Christmas Eve was frosty, calm, and foggy, but Christmas Day was dull and rainy at first; afterwards there was clear moonlight, followed by slight frost. Hail, sleet, and snow fell in heavy showers on Saturday, when there was a fresh breeze from E.N.E. to S.E. In Dublin the mean height of the barometer was 30.234 inches, pressure rising to 30.454 inches at 9 a.m. of Friday (wind, N.W.). The corrected mean temperature was 37.4°. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 36.7°. The screened thermometers rose to 47.5° on Tuesday, having fallen to 24.1° on Sunday. The precipitation amounted to 2.39 inch on four days, 1.10 inch being registered on Friday. The wind was variable, and for the most part light.

Very cold, dry, and piercing easterly winds prevailed during the last four days of the month—culminating in a severe gale on the 30th, after which there was a fall of hail, snow, and soft sleet (graupel). A thaw set in on the evening of the 31st.

The rainfall in Dublin during the year ending December 31st has amounted to 27.362 inches on 210 days, compared with 27.172 inches on 193 days in 1889, 29.079 inches on 190 days in 1888, 16.601 inches on 160 days in 1887, and a twenty-five years' average of 27.036 inches on 1943 days.

At Knockdolian, Greystones, Co. Wicklow, the rainfall in December, 1890, was 2.785 inches distributed over 14 days. Of this quantity 7.80 of an inch fell on the 2nd, and 6.50 of an inch on the 18th.

## RAINFALL IN 1886,

At 40, Fitzwilliam-square, West, Dublin.

Rain Gauge.—Diameter of funnel, 8 in. Height of top—above ground, 3 ft. 2 in.; above sea level, 50 ft.

The rainfall was only 134 of an inch in deficit of the average annual measurement of the twenty-five years, 1863-88, inclusive—viz., 27.696 inches.

It will be remembered that the rainfall in 1887 was very exceptionally small—16.601 inches, the only approach to this measurement in Dublin being in 1870, when only 20.650 inches fell, and in 1884, when the measurement was 20.467 inches. In seven of the twenty-five years in question the rainfall was less than 26 inches, and in 1885 it was 26.614 inches.

The scanty rainfall in 1887 was in marked contrast to the abundant downpour in 1886, when 32.966 inches—or as nearly as possible double the fall of 1887—fell on 220 days. Only twice since these records commenced has the rainfall in Dublin exceeded that of 1886—namely, in 1872, when 35.566 inches fell on 238 days, and in 1850, when 34.512 inches were measured on, however, only 188 days.

In 1890 there were 200 rainy days, or days upon which not less than .01 inch of rain (one hundredth of an inch) was measured. This was in excess of the average number of rainy days, which was 194.3 in the twenty-five years, 1863-88, inclusive. In 1888—the warm dry year of recent times—as well as in 1887, the rainy days were only 160, and in 1870 they were only 145. In 1868, however, the rainfall amounted to 24.635 inches, or more than 8 inches above the measurement in 1887, and even in 1870, 20.832 inches were recorded. Included in the 200 rainy days in 1890, are 21 on which snow or sleet fell, and 28 on which there was hail. In January hail was observed on 3 days, in February once, in March on 3 days, and in April on 5 days. Hail also fell once in May, August, and October, twice in June, 5 times in November, and 6 times in December. Snow or sleet fell on 5 days in January, on 2 days in February, on 6 days in March, on 1 day in April, on 1 day in October, on 3 days in November, and on 3 days in December. Thunder occurred on four occasions during the year—on March 8th, April 26th, and June 11th and 28th. Lightning was also seen on one occasion in each of the following months—viz., May, August, September, and October.

The rainfall was distributed as follows:—7.470 inches fell on 45 days in the first quarter, 5.943 inches on 46 days in the second, 7.442 inches on 57 days in the third, and 6.707 inches on 49 days in the fourth and last quarter.

Of the 6.707 inches which fell in the fourth quarter of the year, 4.212 inches were measured in November on as many as 27 days.

## MARRIAGES, BIRTHS, AND DEATHS registered in the Year 1890.

## E.-PROVINCE OF LEINSTER.—MARRIAGES, BIRTHS, AND DEATHS, 1890.

## SUPERINTENDENT REGISTRAR'S DISTRICTS, ARRANGED BY COUNTIES.\*

Whenever the minus sign (-) is prefixed to the number given in the column headed "Deaths over Births," it denotes that the births, instead of exceeding the deaths, were, in fact, less than the deaths in the extent stated.

Note.—The Registrar's Districts are subdivided by the Census or Representative Registrars' Districts, and are numbered with the Inspector's Districts. The letter "T" denotes that the Registrar's District contains within its limits the Workhouse belonging to the Dublin Superintendent Inspector's District. Wherever the census name (i.e.) is prefaced to the numbers given in the column headed "Number of Births over Deaths," it denotes that the letter, instead of naming the district, will be given in full in the extractors.

BIRTHS AND DEATHS Registered in the Year 1890—REGISTRARS' DISTRICTS, arranged by COUNTIES and SUPERINTENDENT REGISTRARS' DISTRICTS—continued.

\* Thus, the number of Marriages in the Aborigines Reservation: Registrar's District may at once be ascertained by referring to the "Abstract of Marriages" to the Superintendent Registrar's District, numbered of one page etc; and in like manner the number of Births and Deaths, of Deaths in different ages, &c., will be found referred to the same Superintendent Registrar's District Number is the appropriate Table.

INDEX TO REGISTRARS' DISTRICTS.

[The Number or Numbers against each Registrar's District in the Third Column refers to the page or pages in which the Total Births, Illegitimate Births, Deaths, &c., in the District during the year are given.]

## APPENDIX.

REPORT on the ADMINISTRATION of the LEGAL WORK of the GENERAL REGISTER OFFICE, DUBLIN,  
for the Financial Year 1890-91.

Sir.—I beg to report that the legal work of your Department during the year 1890-91 was administered as follows:—

During the year 662 cases of various offences against the Registration Acts were reported by Local Officers, and came under investigation in this department. In a large number of these it was found that no proceedings could be taken against the responsible parties, as the legal time for doing so had elapsed, while in others the delinquents came forward and complied with the requirements of the law, or becoming aware that proceedings against them were in contemplation.

After careful inquiry into the circumstances and examination of the evidence available, in 229 cases prosecutions were directed against the offenders. In 122 of these the parties were convicted and punished; in 70 cases the proceedings were withdrawn, the parties (in most cases) paying the costs of court and complying with the law, in 19 cases the summonses were dismissed, while in 18 instances the cases have not yet been heard in court.

The cases dealt with included the following offences:—Neglect to register births; neglect to register deaths; neglect to furnish certificates of marriage; failure of coroner to furnish certificate of inquest; giving false information as to age at death, as to the cause of death, and as to duration of illness previous to death; issuing false medical certificate of cause of death; giving false information as to births, viz., registering illegitimate children as legitimate, and misrepresenting date of birth; burying two bodies in the same coffin without notice to the Registrar, &c.

The following are the details in a few of these cases:—

V. C. was prosecuted at the Metropolitan Police Court, under sec. 30 of the 43 & 44 Vic. cap. 18, for (1) wilfully making and forging false certificates of the cause of death in the cases of two children; and (2) for giving same as true to the mother of the deceased children. He was convicted and fined.

P. M. was prosecuted at the Metropolitan Police Court, under sec. 19 of the 43 & 44 Vic. cap. 18, for failing to deliver to the person who buried the bodies the notice required by that section of the fact that the coffin contained more than one body. He was convicted and fined with costs.

G. T. was prosecuted at Belfast Petty Sessions for giving to the Registrar of Castlecragh, No. 1 District, false information as to the date and place of death when registering same. He was convicted and fined £5 and £1 costs, or two months' imprisonment with hard labour.

J. V. was prosecuted at Ballyhaunis Petty Sessions for giving to the Registrar of Kilkelly District false information regarding the place of death and age of a deceased person, and falsely representing himself as having been present at the death. He was convicted and fined £1 and £1 costs, or one month's imprisonment with hard labour.

M. B. was prosecuted at Arthurstown Petty Sessions for giving to the Registrar of Fethard, No. 1 District, false information as to the date of a birth, with a view to avoiding the necessity for a statutory declaration, the child being at the time over three months old. He was convicted and fined £2 and 10s. costs, or one month's imprisonment.

L. M. was prosecuted at Legioniel Petty Sessions for having registered with the Registrar of Belfast, No. 9 District, an illegitimate child as legitimate. She was convicted and fined £1 and £1 costs.

J. McG. was prosecuted at Stranorlar Petty Sessions for giving false information to the Registrar of Clogban District regarding the age of a deceased person, for the purpose of defrauding an Insurance Company. He was convicted and fined £1 and costs of Court.

Notwithstanding the vigorous measures adopted by the department for the punishment of offenders, several Registrars report that they believe false information is frequently given to them especially in cases of death.

The modus operandi appears to be as follows: when a member of a family is entered in a Friendly Society or Industrial Assurance Company, the age is frequently given as much below the real age in order to reduce the amount of the premium payable. After a time the person dies, and then the registry is effected so as to suit the statements previously made to the Society or Company.

It sometimes happens, however, that the informant overlooks the fact that the age in the register is to correspond with the age in the policy, and, in order to obtain the money, another nefarious proceeding is then necessary, viz., the making a declaration before a magistrate, altering the age correctly given in the register to an incorrect age, to agree with the age in the policy.

The greatest pains have been taken to obtain evidence in these cases to convict the offenders, but in many of them, I regret to state, for want of documentary proof of age, the case had to be abandoned, though no reasonable doubt existed that the offence had been committed.

The absence of reliable records of birth or baptism in the case of old persons, makes it exceedingly difficult to deal with them. In several cases the age of a deceased person has been successfully proved from a marriage register, giving the age at time of marriage, and in other cases the age inserted or proposed to be inserted in the register has been proved to be impossible from the records of the births or baptisms of the children of the deceased.

The Department is greatly indebted to the Inspector-General of Royal Irish Constabulary and the Commissioner of Metropolitan Police for their kind assistance in investigating these numerous and varied criminal cases.

In addition to the above mentioned, there were a number of cases during the year in which proceedings were taken under the 25 & 27 Vic., cap. 80, before the magistrates at Petty Sessions for corrections in marriage registers, the summonses in these cases being issued at the instance of local Registration Officers.

A sum of £100 was provided in the estimate to meet legal charges. The total cost of the legal service of the Department during the year was £128 10s. 7d., of which sum £91 19s. 8d. was paid for local professional assistance and ££2 6s. 0d. for mileage to the Registrars.

I am, Sir,

Your obedient servant,

R. E. MATHESON,  
Barrister-at-Law.

THOMAS W. GRIMSHAW, Esq., M.B.,  
Registrar General.

DUBLIN CASTLE,

5th February, 1892.

Sir,—I have to acknowledge the receipt of your letter of the 3rd instant, forwarding, for submission to His Excellency the Lord Lieutenant, the Twenty-seventh Detailed Annual Report of Marriages, Births, and Deaths registered in Ireland during the year 1890.

I am, Sir, your obedient servant,

W. S. B. KATE.

The Registrar-General,  
Charlement House, Dublin.
